1. AUTO Folder Programs -- How do they replace system functions?

Newsgroup: comp.sys.atari.st
Date: 1992-01-01 04:24:40 UTC
From: mforget@ersys.edmonton.ab.ca
Message-ID: <TRsuDB2w164w@ersys.edmonton.ab.ca>
Source record: 227401
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

For a long time, I've been wanting to replace one of the ST functions with one of my own. For example, a critical error handler that tells you what the error is in words, and what might have caused the problem. Or I'd like to be able to press a key from the desktop and run a program. Or even just make the screen invert colors after a period of mouse inactivity. The point is that the method of doing this escapes me. The screen inverter could be done with an accessory, but that would waste a slot. I suppose a practical example might be this:

When the user presses TAB from a GEM program, an alert appears telling the total ammount of free memory available. Again, this could be done using an accessory, but it shouldn't have to be. I've seen all kinds of programs that install themselves in the AUTO folder and activate themselves when a key is pressed.

Does anyone know how I could do this? I use Personal Pascal mainly for programming, but I also have access to Sozobon C and Modula-2. Or even assemmbly, although I can't write anything in assemmbly. The assembler is the german Shareware one recently released.

2. VME and expansions

Newsgroup: comp.sys.atari.st
Date: 1992-01-01 05:46:26 UTC
From: aa399@cleveland.Freenet.Edu
Message-ID: <1992Jan1.054626.8017@usenet.ins.cwru.edu>
Source record: 227402

Hi, I'm kind of confused about what VME actually is and would like
to know some things about expansions slots.

I hear VME is almost a standard in Europe. Expansion slots are the
way PCs are expanded in the U.S.

I hear there are 3U boards which the TTs have. I've been told that
they are not the complete version.

I'm also told that there are 6U and 9U boards. What is the
difference between the boards?

How much do each cost if you want to buy one or want to buy them
in quantities?

If Atari did some rearranging with the 1040 STe, could a VME be placed
in it or would it fit? Are there just plain VME bus or are they cards?

Would it be nice if Atari had a few VME boards in the TTs and Mega STes
or is one enough?

Why is there one port on the Mega STe on back of the VME and two ports
on back of the TT/030?

Ok, now on to my expansion questions. I know this isn't an Amiga
newsgroup but if anyone knows, I'd appreciate an answer. What type
of cards does the Amiga 2000 accept? PC cards?

Also, how many expansion slots are there on an Amiga 2000 and 3000?

And lastly, which is better and why, VME or expansion slots?

THANKS. I know many people would also appreciate an answer to these
questions.

3. 512 color games? Any out there?

Newsgroup: comp.sys.atari.st
Date: 1992-01-01 11:16:48 UTC
From: swood@vela.acs.oakland.edu
Message-ID: <12449@vela.acs.oakland.edu>
Source record: 227403

Are there any games in the world of the STe and Rainbow TOS that use the good resolution 512 color pictures that the spectrum graphics do?

would appreciate any replies...

thanks

swood

4. Sozobon 2.0 and 8bit chars

Newsgroup: comp.sys.atari.st
Date: 1992-01-01 13:30:50 UTC
From: jan@janhh.hanse.de
Message-ID: <2950.01.92@janhh.hanse.de>
Source record: 227408

Why do some people belive that the 8th bit in char doesn't matter ?

It always puts a little salt into otherwise good software when I see
that eg. in german special characters the hi bit is stripped off for
no reason at all.

I couldn't reach the authors of Sozobon C, but maybe somebody can tell
them (and all other Amercican software writers) that there are people
out there who care for that extra bit!

Jan

5. Re: Atari TTM195 Monitor

Newsgroup: comp.sys.atari.st
Date: 1992-01-01 14:50:28 UTC
From: aa399@cleveland.Freenet.Edu
Message-ID: <1992Jan1.145028.17894@usenet.ins.cwru.edu>
Source record: 227405

Can someone tell me what TT color monitor handles the ST modes
and the new TT color modes? These resolution include:

320x200 16 colors
640x200 4 colors
640x400 2 colors
640x480 16 colors

And maybe 320x480

I'm not too familiar with the TT/030 since there aren't that many
in the U.S. yet.

Also, are these monitors capable of anything above these resolutions.

The 1280x960 resolution requires the TTM194 or I guess the new one--TTM195.

And how much do each of these monitors cost around (U.S. money)? Thanks.

.

> Can anyone explain why Pagestream is SOOOOOOO SLOOOOOOOW. Its not as if it doe-
> s anything radicly different from Calamus oes
> anything radically different from all the other DTP packages, so why does it l-
> oload and run so slowly?

This (and the other recent DTP discussion) is not a proper question for
the .tech newsgroup, so I've crossposted this answer to comp.sys.atari.st
and ask that any further discussion take place there.

I don't regard PageStream as ``SOOOOOOO SLOOOOOOOW'' in comparison to
similar PostScript-capable programs running on other comparable machines.
In fact, if you'll go spend some time playing with PageMaker on a PC
running Windows with anything less than a '386-16, you'll come to regard
PageStream a a real piece of greased lightning. You'll also come to regard
PageStream as a very capable, very stable program that need not be
embarrassed in any crowd.

Calamus is a very different animal. It uses a single proprietary imaging
method to generate screen and output images. This is much simpler than
having to support several different output methods, as does PageStream.
The program's internal data representation can be more closely matched
to the standardized output. The result is that Calamus can generate
pages faster than PageStream -- in fact, faster than any other publishing
program I've seen on any computer -- but it comes at a cost, which is
the well-known and oft-lamented inability of Calamus to drive industry-
standard PostScript devices.

Issue #9153 of Z*Net, one of the weekly online Atari magazines, has an
excerpt from the Seybold Report on Desktop Publishing that is worth reading
if you're interested in desktop publishing on Atari hardware. The file
can be obtained from atari.archive.umich.edu.

8. HELP!!! I need an ATARI 800 keyboard... PLEASE!

Newsgroup: comp.sys.atari.st
Date: 1992-01-01 21:31:12 UTC
From: jdz1@Ra.MsState.Edu
Message-ID: <1992Jan1.213112.25258@ra.msstate.edu>
Source record: 227409
Cross-posted to: comp.sys.atari.8bit,comp.sys.atari.st,comp.sources.wanted,misc.wanted,misc.forsale.wanted

Hi friends,
I _REALLY_ need your help!!! One of my mothers TEN cat
has managed to render my Atari 800 in-operable. Some of my
keys don't work correctly on my poor, poor machine. As you
know it's almost impossible to communicate with a computer
without a fully working keyboard 8-(. The deal is that the
cat pissed on the computer and I belive it has success fully
ruined the keyboard. It might be too much corrosion in the
keyboard section of the main board.
Well, I am hoping that someone out there has pieces and
parts of one of these machines out there and they just want
to get rid of it. Of course I'll pay shipping and a little
more if you really need it! I'm also looking for schematics
on this Atari. Maybe someone out there has an Atari 8-bit
packed away somewhere like the attic, and they wouldn't miss
it! I belive you get the general Idea, so I'll close with
that thought. PLEASE E-Mail me _ANY_ responses!!!

Looks like it could be a badly written virus at work messing up the disks.
If you don't have a program to check for viruses, it is worth getting one.
Of course, if you have one then use it.

10. Chaos S. B. Help

Newsgroup: comp.sys.atari.st
Date: 1992-01-02 02:18:26 UTC
From: 34ZDFYS@CMUVM.CSV.CMICH.EDU
Message-ID: <92001.21182634ZDFYS@CMUVM.CSV.CMICH.EDU>
Source record: 227412

Hi there. I've been playing CSB all break now and have run into a slight impass. I'm on the level with the flying serpents (Dain). Anyhow, I've opened up the secret doors, found the gate by the vorpial blade (by placing an object in the alcove, I opened up the wall) and have found the door which needs a winged key. Now for my problems:

1) How do I get the key in the middle alcove? (I'm in the room with the map which describes the doors each of the buttons a, b, and c open)?

2) What type of key do I need to open up the door in the Cistern? I had some gold keys but I've long since lost them.

3) Same question for the gate by the vorpial blade.

4) I've gotten to the Dragon den and back (alive after 2 nights of frustrated reloading of past saved games). I was wondering where I can find the 'power tower' I need to show to they eye?

5) I've been through 'Fighters Charge' in the DDD room. How do I follow the way of the Wizard?
(i.e. how do I get past those damn pits to see what else is on that level?)

6) I've gotten 3 different 'gem' keys, Saphire, emerald, turquois. I assume that the key in the flying serpent room is another gem which I'll have to use someplace else. What are they used for? (o.k. I know I'm getting ahead of myself here, but school starts in another week, and I don't want to spend ALL of my time playing games ;)

7) Are there any help files/maps available? If so, could someone please send me locations (ftp sites) and instructions for dl-ing them?

8) Last question!!! I've gotten an encoded scroll. Does the code mean anything, or can I stop trying to figure it out?

Boy, this list got long in a hurry. Any help would be most appreciated.
Thanx in advance

bob

11. Calamus/Outline

Newsgroup: comp.sys.atari.st

13. How can you get Composite Video from Atari 1040ST

Newsgroup: comp.sys.atari.st
Date: 1992-01-02 13:59:50 UTC
From: lezo@syma.sussex.ac.uk
Message-ID: <1992Jan2.135950.4630@syma.sussex.ac.uk>
Source record: 227420

I would like to connect a colour TV (Matsui Model 1455) to an old-style 1040ST which doesn't have an RF socket.

Apart from purchasing an RF Modulator - could the UK Readers of this Please suggest a possible supplier - is there anyway I can connect it to the 1040 using the Video In/Audio In Phono Sockets of the TV with appropriate connections from the ST's monitor socket (And no - the TV doesn't have a Scart socket).

In my handbook for the ST, 'composite video' is mentioned as being available on pin 2 but in combination with the Ground pin I can't get it to work. I'm not sure whether my soldering is at fault or whether even though the ST handbook talks about composite video, it is actually available on a vintage 1040 ST.

Has anyone managed to get a composite video signal out of a 1040ST? Is it even theoretically possible?

Lez

P.S. You can buy the monitor 'din' plugs from Maplin - price approx. 50p

>Actually, Turbo ST 1.84 (the latest) is an AUTO program, not an ACC.
>
Actually, Turbo ST 1.84 is both. You get an ACC to use (if you like it that way) and a program to use in your AUTO folder. I use the ACC version, but have the program in my AUTO folder named ".prx" in case I ever want to use it. Also note that there are two versions - one for COLOR resolutions and one for the MONO resolution. (Apparently, TST does not work on the TT.)

Quick ST 3.0 is now being sold in the UK by the invaluable 'ST Club'.
With it comes a large-screen emulator (for TOS 1.4 and above), desktop
customiser and a few other bits and pieces. Cost: 19 pounds 95, or
12 pounds 95 to 15th January. I bought one and consider it money well
spent.

Details from: ST Club, 2 Broadway, Nottingham, NG1 1PS. Tel: 0602 410241.

Information offered in good faith but E&OE.

22. IBM software emulator

Newsgroup: comp.sys.atari.st
Date: 1992-01-02 17:11:51 UTC
From: unknown@disk.uucp
Message-ID: <1992Jan02.171151.14033@disk.uucp>
Source record: 227419

Hmm, I've a few questions about IBM emulation:
Why not just make a program that converts an IBM program to an ST runnable one? I'm not really concerned with graphical programs, just basic IBM compat. ones.. Wouldn't it be possible to load the program into memory and spend a few minutes to convert it? Then you could have a somewhat faster application, and it could be used without loading a special emu.

If the problem is a legal one, is there any documentation on how to make one of these types of programs? Or are there any "underground" versions of such a beast?

Finally, I'll buy a used (BUT WORKING) copy of a good IBM software emulator if the price is right. If we come to an agreement, you have to send the disk first, so I can check it out.. (I never claimed to be trusting) :)
Better yet, if anyone just wants to throw away their emulator, I'll pay for postage! :)

Well, as you say you could use evnt_keybd() to do this from an ACC. To do this from an AUTO program, would, I beleive require you to intercept the TAB keypress.This would prevent the TAB from getting to the GEM program which you said we were running. I think the best way is to have it as an ACC and then evnt_keybd() (or evnt_multi()) for something such as alt-TAB, this way, because no program I no of uses alt-TAB you don't have to worry about interceppting it...

From: klassa@asdsun.larc.nasa.gov
Message-ID: <1992Jan2.192848.16928@news.larc.nasa.gov>
Source record: 227426

Does there exist a diet/nutrition analysis program for the ST?
I've seen offerings on other platforms (most notably IBM PC's)
that allow you to enter things like "I ate a tuna sandwich for
lunch" (in some form or another) and it determines how many
calories were in that sandwich and keeps track of things like
%fat, %carb's, etc. Anyone know of something like this for
the ST?

Thanks!
John Klassa
klassa@asdsun.larc.nasa.gov

P.S. Reply directly to me, as per "followup-to" line. I'll
post a summary if anybody cares...

>Hi, I'm kind of confused about what VME actually is and would like
>to know some things about expansions slots.

Well, your first point of confusion is assuming that VME and "expansion slots" are mutually exclusive. These terms are both related to a topic which I'll call system bus design.
>
>I hear VME is almost a standard in Europe. Expansion slots are the
>way PCs are expanded in the U.S.

The VME spec is a system bus design specification, just like ISA or AT-bus is a bus spec. In both cases you have a "backplane" which is mostly a bunch of address, data & control signals, and "expansion cards" which attach to the backplane. I don't really like the term "expansion slots" since that implies a system dependence on the actual physical slots, and such a dependency doesn't really exist. In the old Apple II series referring to "slots" made sense because there were only a fixed number of them, and they were mapped to specific regions of memory, so a "slot" equated with a bus region. On a PC or VME bus a "slot" is simply a card holder, and is otherwise nothing special.
>
>I hear there are 3U boards which the TTs have. I've been told that
>they are not the complete version.

They're referred to as A24/D16 boards, with A and D referring to address and data lines, respectively. A24/D16 means 24 address lines and 16 data lines, naturally enough. Many other configurations exist, like A24/D24 and A32/D32 and so on... A24/D16 makes sense on a plain 68000-based machine like the ST or STe, since the 68000 also has only 24 address lines and only 16 data lines. A32/D32 would have been more appropriate for something like the TT that uses a full 32 bit processor...
>
>I'm also told that there are 6U and 9U boards. What is the
>difference between the boards?

Physical size, number of connectors available, and number of signals on the various connectors.
>
>How much do each cost if you want to buy one or want to buy them
>in quantities?

dunno...
>
>If Atari did some rearranging with the 1040 STe, could a VME be placed

>in it or would it fit? Are there just plain VME bus or are they cards?

Not sure what additional support (if any) is required. For the most part,
a VME bus consists of the signals you find on a 680x0 CPU.
>
>Would it be nice if Atari had a few VME boards in the TTs and Mega STes
>or is one enough?

Again, don't drag "slots" into the discussion. You can stick any number of
devices onto a bus, whether it's PC bus or VME bus. In both cases, if the
number of devices you want to plug in exceeds the number of physical slots
you have, you just go get a bus extender, which plugs into an existing slot
and gives you X number of new slots.
>
>Why is there one port on the Mega STe on back of the VME and two ports
>on back of the TT/030?

huh?
>
>Ok, now on to my expansion questions. I know this isn't an Amiga
>newsgroup but if anyone knows, I'd appreciate an answer. What type
>of cards does the Amiga 2000 accept? PC cards?

Amiga-specific, not PC, although if you get the Bridgeboard you can use
PC cards in that.
>
>Also, how many expansion slots are there on an Amiga 2000 and 3000?

dunno.
>
>And lastly, which is better and why, VME or expansion slots?

Irrelevant question, as I hope you've seen by now.

In article <1992Jan1.054626.8017@usenet.ins.cwru.edu> aa399@cleveland.Freenet.Edu (Len Stys) writes:
~>
~>
~>Hi, I'm kind of confused about what VME actually is and would like
~>to know some things about expansions slots.

~>I hear VME is almost a standard in Europe. Expansion slots are the
~>way PCs are expanded in the U.S.

VME is a bus specification - it specifies how a card must electronically communicate and how it should physically connect to the bus. PC's (IBM-style) have three common bus specifications: ISA (Industry Standard Architecture), EISA (Extended ISA), and MicroChannel. Most MS-DOS PC's are ISA.

~>I hear there are 3U boards which the TTs have. I've been told that
~>they are not the complete version.

~>I'm also told that there are 6U and 9U boards. What is the
~>difference between the boards?

3U, 6U, and 9U refer to the size of the board . 3U is about the height of a PC expansion card (3" high give-or-take), 6U is twice as high, and 9U is three times as high. Typically a 3U card will have one physical connector, 6U two, and 9U three.

~>How much do each cost if you want to buy one or want to buy them
~>in quantities?

Cost is totally dependent on what the card does. A simple serial card would be less expensive than an Ethernet card which would be less than a high-end graphics card. Because these cards aren't usually sold in the same quantity as a PC expansion card they tend to be more - maybe $500 on the low end on up. There could certainly be exceptions to this, however.

~>If Atari did some rearranging with the 1040 STe, could a VME be placed
~>in it or would it fit? Are there just plain VME bus or are they cards?

Electronic circuitry needs to be present on the motherboard to communicate with the bus. Therefore you would need more for a 1040STE than just some room to put the bus, but theoretically a company could make a hardware add-on which could support VME bus.

~>Would it be nice if Atari had a few VME boards in the TTs and Mega STes
~>or is one enough?

I assume you mean slots, not boards. This is a subjective question, but I suspect the most common uses for the VME slot will be graphics and networking.

If someone comes out with a good combination card the single slot will probably be sufficient - otherwise bus extenders are available which will give up to 21 slots (though you'd obviously not be able to fit them within the Mega STe / TT.

~>Ok, now on to my expansion questions. I know this isn't an Amiga
~>newsgroup but if anyone knows, I'd appreciate an answer. What type
~>of cards does the Amiga 2000 accept? PC cards?

I believe the Amiga supports its own proprietary bus, as well as one or two ISA slots. Proper software drivers need to be written to use standard ISA cards in an Amiga, of course.

~>And lastly, which is better and why, VME or expansion slots?

Again, assuming you mean "Which is better, VME or ISA (AT-bus)?", it depends what your needs are. VME bus is capable of sustaining very high data rates, but requires more circuitry to support (therefore higher hardware costs). ISA allows for very inexpensive cards (I've seen $19 serial and video cards), but can't sustain nearly the data rate, and doesn't allow for a "bus master" card, which can take over the bus for certain functions.

~>THANKS. I know many people would also appreciate an answer to these
~>questions.

Sure.

~>Len Stys

32. ST/UNIX compatible LHARCs

Newsgroup: comp.sys.atari.st
Date: 1992-01-03 00:21:09 UTC
From: fox@VULCAN.NOARL.NAVY.MIL
Message-ID: <9201030021.AA10871@vulcan.noarl.navy.mil>
Source record: 227430

At the risk of starting another archive-method holy war, can anyone point me to a Unix (Sun specific would be fine) lharc version which can unpack the newer files that are showing up at atari.archive? I prefer to unpack files initially on the Sun at work, check out the README's etc, before taking the archives home but many of the new files produce errors along the line of: "sorry - cannot extract this method".

PS - I used 'archie' to track down unix lharc's with recent dates, but they all seem to be minor variants of the "C-LHarc for UNIX Version 1 (c) 1989-1990 Y Tagawa, Kai Uwe Rommel" version.

Thanks.

33. TT/030 why the ST RAM?

Message-ID: <1992Jan3.031017.28986@usenet.ins.cwru.edu>
Source record: 227432

I've read a lot of articles on the TT/030 and David Small's 68030 SST.
However, I still have some questions.

One of my questions is why is there a need for ST RAM in these machines?

Why can't they just have fastRAM?

It would be great if the TT/030 could use fastRAM only to run ST
software.

David Small says that a reason for the 4 megs of ST RAM in his
hardware is because video and disk have to come out of it.

But why?

Sorry for all these questions but there is only one way that I'm
going to learn. Thanks.

Hi again!

I've tried the Beep, Click & Play sound utilities, but think they're a bit too outdated now that we've got the STe DMA sound & the Xcontrol Control Panel. Does anyone know of a CPX that does the same thing as those small auto (and desktop) programs (replacing the system beep with a sampled sound and assigning sounds to different keys)? Having it as a CPX module would make it easier to configure, with all the sound-picking being done with a fileselector call from the CPX and having everything in one place. DMA Sound support to get more processor time to other things...

If there is such an utility, Freeware/Shareware/Commercial anything, please mail me!

Perhaps, but the idea is to create a program that does this without using
up an .ACC slot. There are only six of them, so it wouldn't be a good
idea to waste one on a trivial task. Aside from that consideration, I
also talked about other programs that couldn't function as accessories,
such as a program that allows you to replace the file selector with one
of your own choosing. The best solution for this would be to tell the
system that the file selector routine is not at the default location, and
then terminate execution using the ptermres() system command so that the
memory occupied by the alternate selector is not erased or used by
another program. The only question is how to tell the system to jump to
a different location when it needs the file selector. This is only one
example. Hotkeys from the desktop should also be possible, but how do
you tell the system to wait for a keypress, and then to execute a program
when one is found. I suppose what I am looking for is a book that would
tell me all of this information, or as much as is available.

> it even theoretically possible?

No, it isn't. The modulator contains two parts: the first half combines the Red, Green, Blue and Sync into PAL-encoded composite video, and the second half modulates a UHF carrier with it.

The pin 2 output is fed from the output of the first half, and so will not be connected to anything in the old 1040STF.

The composite video output works fine on my old 520STM.

Tony.

>The STFm has a TV-modulator on board.

The ST had no internal disk drive, and the power supply was external too.
The STM was as above but with a TV modulator (I know, I've got one!).
The STF looks like an STFM, but has no TV modulator and has a Single-sided
floppy, as did the early STFM's.

>
>MEGA STE <-> TT:
>The MSTE has no SCSI-Port, the TT has one.

The TT also has an IBM-PC VGA compatable monitor port instead of the normal
ST one. (I KNow, I've got one of these too :-))
This gives two extra resolutions with the Atari "Multi-sync" monitor,
640x240 256 colours
640x480 16 colours, both out of a palette of 4096.
The TT also has an 68882 maths co-processor as standard (using the standard
Motorola co-processor operations to access it, unlike the Atari bodge on the
MegaSTE).

This would not work because keypress events goes to the owner of the top window... Which means that the accessory need to have a window open - and topped.

>this from an AUTO program, would, I beleive require you to intercept the
>TAB keypress.This would prevent the TAB from getting to the GEM program
>which you said we were running.

Exactly how would you make your resident program do an alert? To make an AES call you need to have an ap_id - which you can't get (beeing resident)!

You may now ask how the 'critical event (sp?)' work, you know the alert that says something along the lines "Your drive is not responding[retry|cancel]" (this vector is called from BIOS level, and the standard routine calls AES). I think that it is a dangerous hack which should not be copied, as a lesson you could try to force the alert from the file selector on pre TOS 1.04 machines (fx by removing the disc from the drive)...

> it even theoretically possible?

On old ST's without the RF modulator, the composite video signal is not
connected at all - that signal comes from the (absent) RF modulator.
So, you can't do it, unless you buy an outboard modulator that can take
the RGB and convert it to composite video and/or RF.

two ways to do this that i could think of:

-- grab and save the ipl 2 vector (vector 26). when a program is
launched a hblank occurs, and you can set up the SSP or whatever, and
restore the hblank vector.

-- do a Pexec 3, put a breakpoint at the start address, then launch
with a Pexec 4 or 6 (6 if you have tos 1.4). When you get trapped, do
the fixup and unpatch the entry point, and let it rip.

> alter any char other than \r.

It's the following line in the source of hcc (tok.c):

if (c != EOF)
c &= 0x7f;

This means

printf("foo <international chars> bar");

turns out to display

foo <nothing or garbage> bar

It's not he dLibs, ist hcc itself!

>
>David Small says that a reason for the 4 megs of ST RAM in his
>hardware is because video and disk have to come out of it.
>
>But why?

David Small's answer is also true for the TT. In the ST, the RAM is actually twice as fast as is needed for an 8 MHz 68000. The other half of the bandwidth is reserved for the video hardware. So, the way things work, the video hardware is always accessing the ST's RAM, alternating accesses with the CPU.

In the TT, the video hardware is much the same, to preserve ST compatibility. The "fast" RAM is memory that the video hardware does not have access to. It is "faster" because all of its bandwidth can be dedicated to the CPU, instead of being shared with the video. (Of course in the TT, it is also faster because it supports 68030 burst mode operation...)

As for disk accesses - I thought the ST DMA operated by stealing CPU cycles, but I guess not. At any rate, the TT has an additional SCSI controller that can directly access fast RAM...

It would be nice if the memory system were designed a little differently, but so it goes. As it is, you can have your code & data live in fast RAM all the time, but you must keep screen memory in ST RAM.

49. scanning frequencies of TTM194

Newsgroup: comp.sys.atari.st
Date: 1992-01-03 22:33:39 UTC
From: wmagro@firenze.physics.uiuc.edu
Message-ID: <1992Jan3.223339.26068@ux1.cso.uiuc.edu>
Source record: 227445
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Does anyone know the scanning frequencies of the high res TT monitor, the TTM194?

I am thinking of buying a TT if I can get a mono monitor I have to work with
the TT in high res. $1000 for a mono monitor is too much for me...

Also, if you know the scanning frequencies for the other TT video modes,
in particular the VGA mode, please give those as well.

Thanks a bunch.

Bill Magro

256 colors, of course.

For these five resolutions you need a standard 14" VGA multisync monitor, or
the Atari one called 'PTC 1426'. The Atari centers the different resolutions
better (again an Atari-special feature :-(

> I'm not too familiar with the TT/030 since there aren't that many
> in the U.S. yet.
Unfortunately.

> Also, are these monitors capable of anything above these resolutions.
Yes - they are nice for heating up your living-room.

> The 1280x960 resolution requires the TTM194 or I guess the new one--TTM195.
You hit the nail. But other 19" or bigger monitors (e.g. EIZO 6500,
Proscreen, NEC 5D) will fit as well.

> And how much do each of these monitors cost around (U.S. money)? Thanks.
This question should be answered by some fellow countrymen.

51. uniterm problem.... HELP PLEASE

Newsgroup: comp.sys.atari.st
Date: 1992-01-03 23:32:53 UTC
From: eugene@cs.athabascau.ca
Message-ID: <2075@aupair.cs.athabascau.ca>
Source record: 227447

I am using Uniterm as my terminal emulator connected to a SUN running Unix. Whenever I use "more" on the SUN and there is a line in the file longer than 80 characters, it bombs out Uniterm (i.e. I try to read a saved e-mail file that have an address line more than 80 characters). VI works fine to read the file. It seems to me that this is probably a correctable problem with Uniterm (otherwise more people would have reported it.) I assume that it is a buffer problem..... but how do I correct it? Can anyone given me some advice?

53. Supra Drive connections

Newsgroup: comp.sys.atari.st
Date: 1992-01-04 00:21:23 UTC
From: n160ao@tamuts.tamu.edu
Message-ID: <7323@tamsun.tamu.edu>
Source record: 227448

I received two suggestions about daisy chaining my 20Mg and 60Mg Supra Drives. Unfortunately I didn't understand the one about soldering the new drive and old drive together. I did understand the other suggestion, but I couldn't find the DMA output on the 60Mg drive.

What I have is a 20MG drive with a case, controller, power supply,host adapter and a 25 Pin output which Supra calls a DMA-SCSI cable.

I also have a 60Mg Supra drive that only has a cable that connects to the DMA port of the Atari ST. The 60Mg drive also has its own case, power supply, controller, and host adapter.

Can I somehow use this 25 Pin SCSI port on the 20Mg drive to supply a data connections to the DMA plug on the 60Mg drive? I have looked at the documentation supplied with the Supra Utilities, but I think these 25 Pin instructions assume that I am going to plug some type of pure SCSI device into the 25PIN port (like a CD player, Tape backup, or a SCSI drive without a host adapter).

I am still trying to get ahold of Supra about this, but every time I call the support line is busy. I did get the new Supra phone number, but that is the one that is always busy.

Thanks.
Mark Lehmann

Thanks, and happy new year.

56. Re-post of the Flow Chart Compiler

Newsgroup: comp.sys.atari.st
Date: 1992-01-04 02:25:13 UTC
From: mfallero@sleepy.bmd.trw.com
Message-ID: <2346.2964b899@sleepy.bmd.trw.com>
Source record: 227152

I have just posted the FlowChart Compiler (FCC) to the atari/new
subdirectory of atari.archive.umich.edu. It is in arc'd format and
contains 4 files: fcc.prg, mymenu.rsc, manual.asc, and an examples file.

The examples file contains two examples of the Flowchart Design Language
(FDL). You can split these examples into two files, compile them, then
view or print the resulting flow charts.

The print capabilities are limited to a Star GEMINI 10X or compatible.
Sorry, this is the first version. I'll make printer support more flexible
in future versions. I'm thinking of a First Word Plus type of printer
driver that you create yourself, but I'll entertain any suggestions.

This is the second time I've posted it.
The first time I forgot to include the resource file.

I'm very interested in bug reports, and opinions regarding use, value, etc.
This program is shareware.

thanks,
Mark Falleroni

57. GNU C++ at atari.archive

Source record: 227153

I've been having a rough time getting GNU C++ installed on my system, and I think I finally have everything in order, except that when I compile a program, I get an error saying that in xfile.o, _vfscanf is not defined.

I checked, and xfile.o is contained in one of the .olb files in the C++ distribution, but I don't have the source and I'm wondering if soemthing else could be causing this error if the libraries are correct (which they probably are). I'm expecting that there is probably a problem in my setup (I'm using a Mega ST 2 with Gulam as my shell).

58. Doug Harrison still supporting Opus?

Newsgroup: comp.sys.atari.st
Date: 1992-01-04 07:48:05 UTC
From: fsctc@lercuts.lerc.nasa.gov
Message-ID: <1992Jan4.074805.28485@eagle.lerc.nasa.gov>
Source record: 227155

Does anyone know whether Opus' author Doug Harrison is still in the business
of upgrading Opus 2.2 to 2.3? I send a check with a floppy to his P.O.Box
address in Baton Rouge, LA back in October and the bank says that my check has
been cleared but I have not heard from Doug. Since my bank does not return
my check, I don't know whether Doug himself cashed it either. Regardless
of whether he still supports Opus, I think he deserves the meager share fee.
It's really a pittance. However, it would be nice to have v.2.3. So, ...
Is he still supporting this package upgrade or has he quit the ST altogether?

Secondly, I have had problems importing OPUS-generated GEM metafiles into
Pagestream. They will print out on my Deskjet+ but will not be imported
into Pagestream nor Easy Draw properly. Does anyone have similar problems?
May I have some hints?

> It's been a while, so I thought I'd ask again: any news on
> progress toward making Spectre System 7 compatible? e.g., is
> it in beta-version yet?
> Just wondering.

I tried a beta-release of Sys 7 on a ST with 4 MB and enough HD, but
it didn't work at all, the boot procedure was aborted with a system
failure. Dave Small told me in August that Sys 7 should run on the TT
with Spectre 3.0, and that Spectre 3.1 will fully support Sys 7.
On my TT/6, there's no chance for Sys 7 due to its 2 MB ST-RAM. You need
at least 2 MB for Sys 7, and with Spectre I have only 1740 K left, and
that's too few.
SInce Dave Small's last posting in c.s.a.s. I came closer to the conclusion
that Spectre 3.1 will _never_ be released, and that all hopes for a
Spectre that is totally compatible to Sys 7 on the Mac side and to the TT
(SCSI, FastRAM, disk drive) on the Atari side are in vain.
All inquiries to Dave Small seem to disappear in /dev/null.

Sorry for bad news,
Markus.

> However, I still have some questions.
As I bought a TT and not a SST board, I will speak only about the TT.

> One of my questions is why is there a need for ST RAM in these machines?
For compatibility purposes. Lots of old programs don't like FastRAM at all.
Therefore, the video controller and the ACSI-DMA can only access ST RAM.

> Why can't they just have fastRAM?
Then, the TT would be a machine not at all compatible to the ST.

> It would be great if the TT/030 could use fastRAM only to run ST
> software.
Yes, it would. But take a look at the millions of programmers - some
of them did their work "fast and dirty", so TT compatibility broke down.

> David Small says that a reason for the 4 megs of ST RAM in his
> hardware is because video and disk have to come out of it.
> But why?
As I mentioned above.

> Sorry for all these questions but there is only one way that I'm
> going to learn. Thanks.
I am not certain if other RAM conceptions for the TT were thinkable, either.
But then, each ST application had to be totally rewritten.
Things happened this way, resign yourself to it :-)

63. AmigaFS

Newsgroup: comp.sys.atari.st
Date: 1992-01-04 14:22:03 UTC
From: zrnkn01@convex.zdv.uni-tuebingen.de
Message-ID: <zrnkn01.694534923@convex>
Source record: 227159

Hello, guys.

I am planing to write a driver.prg with which there would be a new partition, which you could open and use like a normal ST-diskdrive. But the difference would be that it actually uses the Amiga-FileSystem, sothat you could read and use this disk on the amiga as well.

Is anybody interrested in such a programm?? If not, i see no need to write that programm, so please respond...

Firstly...

The tcsh port on Atari.archive does not support the cursor keys as
far as I can tell. (The ST/TT's cursor keys do not produce codes which are
easily read, you have to use specific GEMDOS calls to find out what they
are).

Secondly...

I was rather puzzled to hear that Uniterm doesn't work on your new
STE as it runs fine on my TT (in ST high-res mode), I would have thought the
STE was closer to the old ST than the TT.

My 520STM has an RF modulator, but it has a problem.. When hooked to
a color TV, a purple line about 1 inch thick and the length of the
screen goes from top to bottom. like this:

```
-------- -------- -------- -------- --------
|------| |______| | | | | |------|
| | | | |------| |______| | |
-------- -------- -------- -------- --------
```

Get the picture? A big, purple bar rolling down the picture..
Is/was this normal? How is it corrected? Would a simple RF filter work?
Thanks!

OK ... I see the problem. Sozobon 1.33i doesn't clear the high bit.
You probably ought to be using octal escapes for data outside the
normal range of printable characters:

printf("The pause that refreshes\276\n");

... but keep in mind that such values aren't portable.

67. PD C compilers for ST

Newsgroup: comp.sys.atari.st
Date: 1992-01-04 20:19:36 UTC
From: pyr579@oz.plymouth.edu
Message-ID: <1992Jan4.201936.19623@oz.plymouth.edu>
Source record: 227163

Hello,

I'm looking for a PD C compiler for the ST. I DLed Sozobon 1.2 from atari.archive, but am having real difficulties getting it to work. I don't really have a good CLI and that may be the problem, but I've fed working code to CC from GEM and it does not compile. Are there any other C compilers out there? I normally use Turbo C++ on Messy Dos machines, but I thought it would be nice to have a compiler on my home machine also. Maybe it is simply a case of getting a good CLI like gulam. Any ideas?

Please E-mail

thanks, Stephan

I would only be interested in an upgrade if Tim could get MBBS3 to run do programs and/or be FIDO compatible or able to handle echo mail.
It's an excellent program but without these facilities it's not much use to me. The echomail facilities are my main concern as I'm on the lookout now for a FIDO compatible program. BTW no body else knows where to get FoRuMfrom either :-(

Well for some older somewhat fogged memory. The arcade Pong was essentially the 1st product, but I recall Bushnell may have done something before that. Computer Space or something, but it wasn't successful. There were a number of home games made that predated the 2600 (I believe). I still have a Video Pinball game sitting on the shelf <grin>. The 2600 was not the first cartridge game. I believe the Fairchild Channel F has that distinction. RCA also came out with a lame non-color system that was doomed before it was even released. Both the Fairchild & RCA systems used hot processors, F8 & 1802 respectively. They had the ability to access 64K of memory vs 8k for the 2600, but Atari had the hotter programers & graphics. A side note: IMHO if you had a 4.77 mHz XT with VGA sitting next to 20 mHz 386 with CGA the average consumer would think the XT to be the better computer.

72. SCSI tape backup

Newsgroup: comp.sys.atari.st
Date: 1992-01-05 08:21:50 UTC
From: Dirk_Steins@k2.maus.de
Message-ID: <A31469@K2.maus.de>
Source record: 227167

jrd@STONY-BROOK.SCRC.SYMBOLICS.COM wrote:

>Does anybody have, or know where I could find, a simple backup program
>to work with a generic SCSI tapedrive? I have an ST with an ICD host
>adapter.

I think i have a solution for you. I've written a tape backup programm which is distributed here in Europe by protar with their streamer packages (their using TEAC drives), but you can get the software without a streamer direct at me. But it is not a simple backup programm, it's more a little bit sophisticated. You can do a backup by different types, i support partition backup where only used data is saved, an image partition backup so you could backup drives from alternative OSs, a file backup where you could comfortably select files using mouse, fileattribute, date or wildcards an last but not least a complete image backup of the whole drive. There's a batch interpreter also included so you can automatically backup the things you want. And there's a recorder for batch files also included.

The software works fine on every resolution with 80 coloums or more (so it will not work in ST-Low or TT-Low, but that should not be any problem at all), supports the TT completely (even the SCSI-Bus) and should work with all types of SCSI tapedrives. I've tested the following devuces:

Teac MT-2ST/45S2, Teac MT-2ST/N50, Wangtek 5150ES, Tandberg TDC-3800, Tandberg TDC-3600, Cypher ST150S-II (only at the TT SCSI-Bus), Exabyte EXB-8200.

With these devices it should work properly, but i think it will support all tapedrives, even if there are one or two features that wouldn't be supported (e.g. recognizing of tape start).

The price for the software is about $ 230,- excl. VAT and shipping costs. There is a demo version available which supports all features except the batch files and restoring data. You can get the demo version by just sending me a letter with a disk and your address.

There's only one problem at all: I've an english version, but the english manual isn't completed yet. So in the moment i cannot send out an english manual, but the software is fully GEM-supported so that this should be not such a great problem. And i would send it with a short english manual an disk (even if i had to write it).

My address is:

Dirk Steins
Auf dem Feldchen 48
D-W5216 Niederkassel-6

Germany

If you want to do Unix compatible backups, i've adapted a tar to the TT
which supports the SCSI-Bus of the TT. Unfortunately i haven't a version
that uses the DMA-Bus on the ST, so you can only use it on a TT. If you're
interested in the tar please send me a mail.

Dirk

GEnie: C.HERBORTH

Sorry, Chris, but i never worked with MinT, because with only one megabyte it's just a bit difficult. But the idea for a additional Spectre or Mac-driver isn't bad. But as you know, those discs you write with normal Atari-drives aren't Mac-readabel. So i perhaps first do the AmigaFS, because it's the one i know and i have lots of information about.

Read ya... =8-)

Not sure about locations, but my guess for some ?'s:
4) You should have found some type of 'power' armor in one of the secret rooms that are in the area: Show it to the eye.
5) If all the proper floor plates etc are set, you should be able to run fast down the hall and the trap doors will close for a brief second while you cross.
6) You need the Turquois key to proceed to part 2 of the Dain Path.
If you've got the game layout figured: There are 4 paths to the DDD and 4 paths that lead from there with the same names. Access to the 2nd series of paths is made by getting objects from the 1st paths.

79. Help! BBS Online Games?

Newsgroup: comp.sys.atari.st
Date: 1992-01-05 22:09:03 UTC
From: michaelw@amiganet.chi.il.us
Message-ID: <michaelw.0zh7@amiganet.chi.il.us>
Source record: 227175

Greetings:

The one thing I remeber from using my Atari was what great Online Games
that were around on the BBS's that were ST's. I Moved over to an Amiga a
year ago when I went off to school for Drafting and computer Design.
I started a bbs not long after that on the Amiga, However to my surprise..
non of the great games that were on the ST, really had made there way over
to the Amiga(or even IBM), this to me is in its own way very sad..
One, they were simple some of the best online games out.. it would be very
hard to find anything of there caliber on any system.... Two) Any time
that somthing has a chance of being forgotten, outdated, overlooked or not
usable in the computer world, it is simplely a crime. My request...
Would it be possible to get the names of any of the Authors that right BBS
Online games for the ST.. Forem being the Biggie... as well as there numbers
(bbs or otherwise) and or to get information on how to contact them via
SNMAIL(Us Postal). I would like to work on doing conversions
of as many games as I can get my hands on.. We have done some work with IBM
And Apple 2 as well as UNIX games in the past.

I will not in ANY way

1) Take Credit for the Games. Someone took alot of time to write them.. I
respect that and wil give FULL credit..

2) Take money for sales and or distribution of an Alter Copy in any
Form.

3) Give out the Source without EXPRESSED authors permission.

4) In anyways.. Destroy, or disfame the games.

I will of course give out all changes to the orignal Author.

I am willing to offer Money in exchange for the code(If really needed..
rembering.. I am a poor college student).

>"composite video signal from an ST"
I am sure that this signal was only available on STFM's. I know this
doesnt make a lot of sense, cos the composite signal has nothing to do with
a modulator, but I am sure that this is the case.

I've heard of a ST program, which I think is called "Stock-->Smart" (or something like that) and was interested in looking at it. It's a Shareware program and if anyone has it, and could possibly e-mail it to me (as I don't have FTP access) I would greatly appreciate it.

Please respond by e-mail, as I don't have access to this newsgroup.

From: jeroen@phil.ruu.nl
Message-ID: <1996@accucx.cc.ruu.nl>
Source record: 227183

A while ago (say, 2 years) someone wrote on the net about patching UniTerm for use with AutoSwitch Overscan.

Alas, I paid no attention back then, but would be interested in the patches now - I just installed PixelWonder and thus now display 768x480 pixels on my SM 124.

Anyone still out there who knows of these tricky matters?

Replies preferably by e-mail, I will post the excerpt to c.s.a.st if anything comes up.

Thanks in advance, Jeroen.

90. Specification for OMTI 5400 needed

Newsgroup: comp.sys.atari.st
Date: 1992-01-06 10:26:42 UTC
From: hschs91om@ap06.rz.tu-harburg.de
Message-ID: <1377@rztsun.rz.tu-harburg.de>
Source record: 227108

I've the problem, that i want to connect an old MFM harddrive with the
OMTI 5400 and an ICD-hostadapter to my ATARI ST. The original ICD-Software
are not regonizing the OMTI 5400, but the software from the book
"Scheibenkleister II" regonize the host as an ADAPTEC 4000/4070 but this
software can't format the harddrive in case of wrong orders to the OMTI,
but the software can read and write an step on the harddrive. Maybe i can patch the
software if i know the parameters for the select, the sense and the format orders
to the OMTI.S

The OMTI 5400 is Rev T with the software Rev. ST.

>compat. ones.. Wouldn't it be possible to load the program into memory
>and spend a few minutes to convert it? Then you could have a somewhat
>faster application, and it could be used without loading a special emu.

It is nearly impossible to write such a program. You could try to
replace every IBM-instruction with a sequence of 68000-instructions
but the problem is: the convertion program cannot differ between
instructions and data in the other program. And then (if that is
possible, e.g. TEXT and DATA are not mixed) what about some
hardware-addresses stored in the DATA-part and accesed indirect. How
to convert these? There are many problems to convert such a program,
too many for a computer. Imagine, you had as much memory as a computer
(which you do) you would not be able to convert a program without
thinking. These are also the reasons why there are not any perfectly
working disassemblers.

>If the problem is a legal one, is there any documentation on how to make
>one of these types of programs? Or are there any "underground" versions
>of such a beast?

Of course, not. You could only try to disassemble a program and convert
the instructions to 68000 (that means: write a compiler for
IBM-instructions), but that will not work perfectly.
So an emulator is the better way.

>Finally, I'll buy a used (BUT WORKING) copy of a good IBM software emulator
>if the price is right. If we come to an agreement, you have to send the
>disk first, so I can check it out.. (I never claimed to be trusting) :)
>Better yet, if anyone just wants to throw away their emulator, I'll pay

If you really want to run IBM-programs on your ST at an acceptable
speed then you should think about a hardware-emulator.

>> to worry about interceppting it...

Using evnt_keybd() from an accessory won't work, because only the "currently active" program gets keypress information from GEM (Don't ask me for a accurate description of "currently active"!)

>> | John Perry*Voice (204)783-0812*Internet marco@sys6626.bison.mb.ca |

You do it by intercepting the GEM TRAP vector and waiting for an fsel_input() AES call.

>This is only one
>example. Hotkeys from the desktop should also be possible, but how do
>you tell the system to wait for a keypress, and then to execute a program

To "hot-key" your program, you need to intercept the IKBD (intelligent keyboard controller) interrupt and look at keypress information as it arrives.

>...The 2600 was not the first cartridge game. I believe the Fairchild
>Channel F has that distinction.

Actually, I believe the first cartridge-based game was the Magnavox Odyssey.
My uncle bought us one of these - it had basically the same level of graphics
as Pong, but had cartridges (actually, just edge connectors with various
interconnections, no silicon on the cartridge) and translucent screen overlays
to place on your TV (held by the picture tube's static charge) for "color".
Games included ping-pong, handball, and a few other variants.

My uncle amazed my brother and I by reverse-engineering the thing and
designing new cartridges for it, including a volleyball sort-of-thing.

It was some time after this machine, as I recall, before cartridges resurfaced
in the Fairchild or RCA machines.

Hmmm, is this what the Video Master (from Practical Peripherals, the folks that make the Monitor Master) does? I have been toying with the idea of hooking my ST to the big TV for games and such, but I have a Mega2. Would the purchase of a Video Master allow me to get good quality output on a commercial TV?

For $850 you will get the following:
(I'll pay shipping UPS)

ATARI MEGA II ST:
Motorola 68000 cpu
2 Megabyte RAM on board (2048 KByte)
1 3.5 disk drive (additional port for second floppy drive)
MIDI ports built in
DMA port
1 serial port
1 parallel port
2 mouse/joystick port
realtime clock with battery back-up
keyboard/mouse/2 joysticks
blitter graphics chip
3 sound channels

ATARI Color Monitor (SM124)
Tweety Board installed (for stereo sound and connections to stereo
systems)
85 MEGABYTE SCSI external Harddrive
28ms seek time
ICD FAST DMA/SCSI ADAPTER Card
ST REPLAY4 Sound Digitizer
2400baud external modem

All original system software included.
All of my atari software (shareware, games, and utilities) included.
All manuals/cables included.

(basically, everything you will need to get the system up and running
in 10 minutes)

If you are interested please drop me a line and make an offer.

thanks,
Wayne

102. Help - 520ST bombs at boot time

Newsgroup: comp.sys.atari.st
Date: 1992-01-06 17:58:29 UTC
From: maurice@maurice.austin.ibm.com
Message-ID: <14753@awdprime.UUCP>
Source record: 227193

Help!

I have an Atari 520ST which has faithfully served me almost 5 years.
When I came home the other day (having left it running, as usual),
the disk drive light was on but there was no sound of disk access.
Turning on the monitor I found two bombs sitting there. I suspected
a house power outage had simply forced a reboot, but there hadn't been
any loss of electricity.

Now, whenever I boot (hard or soft), I get the red lines across the screen
like I always have (I've always thought of this as an "image" of memory -
is this correct?), screen clears, disk light comes on (again, no mechanical
activity in drive), and two bombs pop up.

In order to try to eliminate one possible cause, I poped out the ROM chips
and tried to boot off of a TOS.IMG disk. I don't get the red line screen
(if memory serves, I didn't get that before I installed the ROMs, but that
was a *long* time ago), the disk light does NOT come on, and I get nothing
on the screen (no bombs).

So, do any of you experienced STers out there have an idea as to what part
of the system might be sick (i.e., does "two bombs" really mean anything).
Or should I just take this as a sign that it's time to go buy a new machine
(probably a 386 - sorry Atari, I thought this was going to be a good personal
system in '86, but, at least in the U.S., it hasn't really taken off).

Thanks for any help.

```
PRICE REDUCED

1040STe and Software For Sale

Atari 1040STe system ( 2 month old, under 40 hours of use)
- Mouse, system disk, User manuals
- Owner's Registration card
- Original packing
I got this system for my kids but they don't like it

Asking $350.00

Programs
Kidprogs - $15 ($27.00 new)
N-VISION ' A professional paint program' -$10 ($19 new)
Hard Drivin' II (execellent racing car simulation type program)-$29 ($39 new)

Take it all for $425 (I will split UPS ground shipping from NH)

Call
Errol 603-882-5125
```

105. TTM194/5 Scan Rates

Newsgroup: comp.sys.atari.st
Date: 1992-01-06 20:46:46 UTC
From: wmagro@firenze.physics.uiuc.edu
Message-ID: <1992Jan6.204646.25912@ux1.cso.uiuc.edu>
Source record: 227196

I asked this before but got no responses. Surely someone knows what the scan rates of the high res TT monitor are (those of you at atari reading this, for example, likely know or can find out).

Have a lot of TTs been sold in Europe? If so, some of you should be able to tell me this info.

By the way, here is my wish list for a TT (read: i won't buy one without these features):

1) Standard SIMM memory upgrade for ST and TT ram. If Apple and NeXT can release 68040 machines with this, so can Atari. In fact, isn't this one of the simplest parts of designing a computer? Just run the address and data lines to SIMM sockets. It always seems that Atari is trying to limit the usefulness of our machines, whether by making constant board revisions that break various upgrades and DMA devices (which by the way wouldn't be necessary if the ST had a bus in the first place), or by making it impossible to add memory to machines (like the mega 2s that were actually mega 4s with a few traces cut). People are going to upgrade and modify their machines with or without a bus...so there may as well be one. Atari, please save us the trouble of hacking up our machines.

2) Cheap and available Unix! If you aren't going to market these machines heavily (=not going to sell a lot and thus generate software support), then you need to give us a reason to buy them. Unix will do that for me and for a lot of other people. Keep in mind that a NeXT 68040 with 8 meg of ram and a megapixel (1024x1024) gray scale display and 105Meg hard drive and Unix costs a student $3500US. Your TT is slower and the monitor is monochrome. Thus TT 8/105 +unix better be less than 3500. Since Such a TT already costs 3500, you would need to make the Unix free or pay us to take the unix in order to sell machines. I want a TT, but not at the current prices.

3) Compatibility. Urge developers, especially game developers, to support the TT as well as the ST. Get them to put 'For Atari ST/STe/TT' on the boxes so we can buy with confidence.

4) Insert your wishes here.

P.S. please tell me the scan rates of the TTM194 high res monitor if you know.

106. MultiGEM & Datadiet

Newsgroup: comp.sys.atari.st
Date: 1992-01-06 21:01:44 UTC
From: jon@nabob.cc.mcgill.ca
Message-ID: <1992Jan6.210144.20793@thunder.mcrcim.mcgill.edu>
Source record: 227197

I got back from extended holidays and am just catching up. I'm one of those unfortunate souls who bought Datadiet & MultiGEM at the same time. What exactly is the nature of the incompatibility? Both seem to run together ok though the system does seem a little unstable.

On a similar note, has anyone gotten GFA BASIC to run reliably in MultiGEM? My system seems very unstable (Mega 2 with TOS 1.2)

Thanks,
JON

>line. Seems to be hard to beat in C.

That's not the point. The point is that UUCICO is (well, was) written GFA
BASIC, and GFA BASIC doesn't work in a lot of environments that people use:
MiNT, TT RAM, etc.

To be fair, OLDER VERSIONS of GFA BASIC suffer from this, but that includes
the version that UUCICO for Mercury was compiled with, last I saw. I don't
know if newer GFA BASIC compiled programs are 32-bit clean and/or do not
access memory they don't own, or make other unreasonable demands of the OS.

109. KWEST Atari User Group Meeting - Wed Jan 8/92

Newsgroup: comp.sys.atari.st
Date: 1992-01-06 22:42:10 UTC
From: daroloso@watmath.waterloo.edu
Message-ID: <1992Jan6.224210.13926@watmath.waterloo.edu>
Source record: 227200
Cross-posted to: ont.micro,kw.micro,uw.sys.atari,comp.sys.atari.8bit,comp.sys.atari.st

In January, the Kitchener-Waterloo Eight Sixteen Thirty-two (KWEST)
Atari user group will have a general meeting with the spotlight on
Picture Formats and Conversions for the ST.

Our 16-bit library currently has over 300 disks of public domain
and shareware software.
In addition, there will be our updated catalog disk and our
disk-of-the-month.
Our 8-bit library is also available at this meeting.

As well as our own newsletter "The Hard Copy", we will also give
to attendees the January issue of AtariUser.

The group welcomes new members and visitors with
8-bits, 16-bits, or those just curious.

Meetings held at the University of Waterloo in the
Math & Computer Building.

Room opens at 7:00 pm. Meeting starts at 7:30 pm.

Wednesday, Jan 8, 1992
DCS Course Room, Room 2009 (2nd floor)

Call 579-3695 for details.

Hope to see you there,
Dani Roloson

110. Re: How can you get Composite Video from Atari 1040ST

Source record: 227199

In a previous article, ksommerville@cix.compulink.co.uk (Keith Sommerville) says:

>I am sure that this signal was only available on STFM's. I know this
>doesnt make a lot of sense, cos the composite signal has nothing to do with
>a modulator, but I am sure that this is the case.
>

The composite works just fine on the STe, too.

What _I_ am wondering, is if there's any way to hook it up to S-VHS. I
know absolutely nothing about the S-VHS except that it's a five-pin
plug, so I've no idea...

|> plug, so I've no idea...

The five pin plug you are referring to as S-VHS is actually called S-Video. S-VHS is a SuperVHS recording standard which is incompatible with the Current VHS standard (S-VHS decks can read VHS tapes, of course, but not the other way around). S-video is a video _signal_ standard, in which the chrom. and luminence signals (what usually make up 'composite') are left in their raw form. This improves the signal by removing one more layer of modulation. The s-video signal maps more directly onto what is going on internally in a tv's electronics. Whether you would gain anything by converting composite to s-video then piping it into your SVHS deck or nice monitor TV is questionable--the TV and vcr do just that to the composite signal they get as input. If you somehow turned your raw RBG signal into a s-video signal (i.e. before the composite out of the ST) you might have better luck.

From: Bob_BobR_Retelle@cup.portal.com
Message-ID: <52467@cup.portal.com>
Source record: 227107

Bjarne Pohlers explained why it would be too difficult to create a "cross compiler" (I know, wrong term, but close to what I mean) that would take an IBM program and create a runnable 68000 version of the same thing...

Maybe I'm missing something here, but how does an emulator work then..?

Doesn't an emulator simply substitute the 68000 machine instructions for the binary 8088 instructions, somewhat like a BASIC intrepreter substitutes groups of machine instructions for tokens as it encounters them..?

Instead of simply executing the 68000 instructions as the IBM program is scanned, why not store them for later running at full speed..?

I understand the difficulties involved with data being mixed into the program, but how then does an emulator handle it..?

114. .mac on st's

Newsgroup: comp.sys.atari.st
Date: 1992-01-07 05:04:18 UTC
From: chan@cs.unr.edu
Message-ID: <2446@equinox.unr.edu>
Source record: 227109

After rediscovering my Picswitch viewer (views many picture formats), I soon discovered that printing out MAC (.mac) pictures gave me the best quality out of the rest of the formats (.pi*, .pc*, etc)... on a printer I just recently purchased.

So I asked around for .mac pictures... (ftp sites, etc)
What I found out was that most MAC files are compressed either in .SIT (Stuff It) or .HQX (Compact Pro ???)...
...and not in the usual .ARC, .LZH, etc...

Anybody have any answers to this problem?

Please email or post.

Hi Stephan,

p> I'm looking for a PD C compiler for the ST. I DLed Sozobon 1.2 from
p>atari.archive, but am having real difficulties getting it to work. I don't
p>really have a good CLI and that may be the problem, but I've fed working
p>code
p>to CC from GEM and it does not compile. Are there any other C compilers out
p>there? I normally use Turbo C++ on Messy Dos machines, but I thought it
p>would
p>be nice to have a compiler on my home machine also. Maybe it is simply a
p>case
p>of getting a good CLI like gulam. Any ideas?

There are two good PD/FREEWARE Compilers:

Sozobon 2.0 (new release; but no ansi) and
GNU GCC 1.40 (full ansi)

As shell I prefer the MUPFEL from the GEMINI-Package..... :-)))

Both are available on FTP or on GEnie.

Bye, Klaus

Message-ID: <1992Jan7.112132.12725@vlsi.louisville.edu>
Source record: 227115

I'm thinking of getting a laptop. For a while I'd contemplated a MAC PowerBook, but why should I switch from the Atari world? Most of the software I would use I'd write myself.

Can someone give some details about the (long awaited) STBook? Specifically,
1. What comparison to ST/STE/MEGA (is it one or the other?)?
2. What internal storage media (floppy/hd)?
3. What kind of screen refresh slow/medium/fast?
4. What expandability (I know there is a (kind of) direct line to the CPU to replace the old cartridge slot, but what else?
5. What memory configurations and how is memory added?
6. What TOS level does it run?
7. Has anyone seen one of these yet?
8. Where can I find a complete review?
Thanks,

Robert Royar

>setup (I'm using a Mega ST 2 with Gulam as my shell).

I had the same problem when I tried to install G++ on my machine. The
g++.olb-library uses the standart C-library. I had installed the
MiNT-library as standart C-library. As there was no function vfscanf
in the MiNT-library I rewrote it. In newer versions (Patchlevel 16)
vfscanf is now included. So just get the MiNT-library and replace your
C-library with it. (Programs compiled with the MiNT-library also run
under TOS). I had just to do the following change in compiler.h:
Somewhere the macro __EXTERN is defined: replace the code for defining
__EXTERN and __PROTO etc. with the following:
#ifdef __cplusplus
# define __EXTERN extern "C"
# define __PROTO(x) x
#else
/* end of added lines */
# ifdef __STDC__
# ifndef __NO_PROTO__
# define __PROTO(x) x
# endif
# define __EXTERN
# else
# define __EXTERN extern
/*
* fudge non-ANSI compilers to be like ANSI
*/
# define const
# define volatile

# ifdef __NEED_VOID__
typedef char void; /* so that (void *) is the same as (char *) */
/* also lets us know that foo() {...} and void foo() {...} are
different */
# endif
# endif /* __STDC__ */
#endif /* __cplusplus */
```

That should work.

Message-ID: <1992Jan7.172444.14203@wpi.WPI.EDU>
Source record: 227119

Hello everyone..

My 1040st's internal disc drive has gone flaky. It
reads and writes single-sided floppys fine. One double sided
it either tells me the disc is full, doesn't read or write st
all, or gets hung up. I looked inside and noticed one of the
heads is slightly bent or askew. The local repair guy said he
has on occasion been able to correct this by bending it straight
again. I am going to try it first and would very much appreciate
any insights on doing this. Secondly, if this doesn't work,
where can I order (preferably by mail) a replacement drive. I
asked about this at J+R Music world but they had no model#
listing for the internal drive. So I'd also be interested in
a source/best price on an internal disc drive as well..
Thanks!

The emulator handles it by dealing with each instruction as it arrives, and not attempting to do much more! You could store the equivalent 68K code for later use, I suppose, but to get a fully converted program, you'd have to make sure you executed every possible path in the program. [It can't be done automatically either, as ensuring that you've executed every possible path reduces to the Turing machine halting problem]

A further problem is that much IBM PC software contains self-modifying code, which blows any sort of object to object translator out of the water!

While we are talking about IBM emulators, is there a 386 emulator with VGA graphics capabilities (assuming you have a VGA monitor/multisync) yet available for the ST/TT, or is one in development? I am most interested in the external type such as Supercharger. Thanks.

>seen the software advertised anywhere and hope that someone reading this
>will know of the program, Where can I get an English Version, What sort of
>price can I expect tp pay?

I would suggest getting it mail order or from a local dealer. I understand ISD
sells it for about $199, and sometimes has specials, but mail-order outlets
often list it for $99. I used it extensively and was very impressed with it.
The output can also be converted to Postscript (miracle of miracles), so you
can use the stuff in other programs. I've seen nice artwork done in it, but in
my opinion it is more suited to logos and headline work.
At any rate, it is a nice program and quite fast...
The documentation is good and there is a step-by step tutorial that covers most
of the features.

By the way, you really should read my cool .sig file ;-)

The following press release is reproduced verbatim.

Taylor Ridge Books
P.O. Box 78
Manchester, CT 06045
(203) 643-9673

FOR IMMEDIATE RELEASE CONTACT: TAYLOR RIDGE BOOKS
(203) 643-9673

FIRST THERE WAS C-MANSHIP COMPLETE.
NOW THERE'S THE ST ASSEMBLY LANGUAGE WORKSHOP!

Manchester, CT January 6, 1992--Taylor Ridge Books has announced the release of The ST Assembly Language Workshop, Volume 1, a novice's guide to assembly language programming on the Atari ST line of computers. Written by Clayton Walnum, the author of C-manship Complete, The ST Assembly Language Workshop, Volume 1 teaches the basics of assembly language programming, starting with assembly language theory and building up to full-length programs. Covered in the 260-page book are the most-used 68000 assembly instructions, programming style and technique, file handling, printer output, system clocks, color palettes, screen flipping, loading pictures, and more. A complete 68000 instruction reference is also included.

When it's released later this year, Volume 2 of the series will cover GEM programming, with Volume 3 tackling various advanced topics. After studying all three volumes, readers will have developed the skills needed to write virtually any type of program on an ST. Even after reading only volume 1, the novice assembly language programmer will be able to write full-featured TOS programs.

The ST Assembly Language Workshop, Volume 1 comes with a disk containing all sample programs and assorted additional files. It is priced at $24.95, plus $3 shipping and handling and can be ordered at the address or phone number above. Visa and MasterCard are accepted.

I'd have to break this down by game category, because how can you say that a good arcade shoot-em-up is better or worse than a role playing game?

BEST SHOOT-STAB-SWAT-HIT-WHACK-FLING AND KILL GAME:

Has to be GODS, by the BITMAP brothers. Awesome graphics, interesting monsters and puzzles.

BEST FLY AND SHOOT THINGS DOWN GAME:

Their Finest Hour: The Battle of Britain (Lucasfilm). What can I say, I like prop planes better than jets.

BEST ARCADE GAME:

Speedball 2 (Bitmap Brothers). Fast action, blood and gore, good level of difficulty (very tough, but beatable), good graphics and great (sick) sense of humor.

BEST 3D GRAPHIC ADVENTURE:

Dungeon Master (FTL). Need I say more?

BEST 2D GRAPHIC ADVENTURE:

Ultima V (Origin). Don't even start this game unless you have a few weeks to kill.

May I also suggest another category:

AVOID AT ALL COSTS:

Captain Blood. Boring.

It is not STE only (in fact, it might be ST only). I am not sure about the
520 compatability. It is definitely worth the time to try though!

Hmmm, I guess I would have to say that Populous has eaten up more of my time than any other. I have been into computer games since the Pong days, and I can honestly say that this is the most original one I have played. It is out for the ST, Amiga, and IBM PC's, and two player games are possible via modem or direct-connect (and you can mix machines, BTW). The Promised Lands extension disk is also very cool, providing 5 more landscapes (the one called "bitplanes" is incredible, and a trip down memory lane computer wise) and 500 more scenarios. I buy this game for my computer friends (as gifts) just to create competition for myself :-). This game is old enough to be on the "reduced" list at most mail order places. I think it might also be part of one of those "game packs". I saw an article in ST Action about the upcoming Populous 2, and it looks very very nice.

By the way, I had the game for awhile and thought it sucked, until I saw a bunch of folks raving about it here on the net. Since most of the stuff they were talking about was greek to me, I decided to give the manual another read and try again. After a couple more games it clicked and I realized just how cool it was. My point is, if you tried it and thought it was one of those "all graphics and no fun" type games, you were doing it wrong! The manual is not the greatest, but I would probably have a very difficult time trying to explain the game in print also. I am getting pretty good at giving hands-on Populous tutorials though :-).

Sheesh, there are a lot of really great games for the ST. Falcon, Projectyle, Speedball II, Gods, Lemmings and Xenon II pop into mind.

>a source/best price on an internal disc drive as well..

There is a file on atari.archive.umich.edu called ibmdrive.lzh, which describes how to hook generic 3.5" and 5.25" drives to the ST. It includes instructional text, diagrams in .PI3 format, and some small programs to make the 5.25" seek correctly. The big concern with getting a replacement floppy is to avoid the media change problem. Some drives will not recognize a media change (changing floppies) with the ST. Toad computers recommends the TEAC drives, which do not have this problem. Toad will probably be willing to sell you a drive and some instructions (or put it in for you, for that matter). Call 1-800-448-TOAD and ask (be sure to get on their catalog mailing list, it is cool).

I am in no way connected with Toad, blah blah. By the way, can we put something about this in the FAQ? This question seems to be asked about once every two weeks . . .

>
> I understand the difficulties involved with data being mixed into the
> program, but how then does an emulator handle it..?

A hardware emulator consits mainly of an Intel CPU.
There are 3 ways for a DOS-program to execute hardware dependent tasks.

(1) issue a call to the DOS operating system (via INT21)
(2) issue a call to the BIOS of the machine
(3) directly access hardware registers

So you can imagine how the emulation is done?

- Instructions like "move this to there" are simply executed by the Intel CPU.
- DOS calls are executed by the Intel CPU, DOS itself calls the BIOS to access the hardware.
- BIOS calls ... hmm. The manufacturer of the emulator has to provide some kind of hybrid BIOS that takes the call from the Intel CPU, enables the MC68000 and accesses the harddisk for example.
- The most difficult part to emulate is direct screen memory or I/O port access. On the emulators I know there's some kind of memory watchdog, that generates an interrupt when certain adresses are used. The interrupt handling routine in the emulator software examines what the program tries to do (write something into screen memory in most cases) and does something that has the same effect using the MC68000 in most cases.

Of course emulation _can_ be done in software. What is impossible is to write some kind of compiler that compiles an IBM program into an ST program since you can't tell which part of the program is code and which part is data _at_compiletime_. (This would be equivalent to solving the halting problem

which is well known to be impossible.)
Emulation in software or hardware can to a certain extent be done
_at_runtime_ - that's the point.

There's an emulation software for the ST that works quite nicely, but, since
"translation" has to be done at runtime it achieves only half the speed of
an XT with even slower screen output.

I think, software emulation is only useful on a TT and I'd really like to
see a good emulator - I would immediately buy it.
A friend of mine runs Soft-PC on his 68020 Macintosh - really good.

Hope, that explained something. I tried to keep my response short.

Cheers, Paddy

134. MiNT and UN*X look alikes

Newsgroup: comp.sys.atari.st
Date: 1992-01-08 00:11:23 UTC
From: pyr579@oz.plymouth.edu
Message-ID: <1992Jan8.001123.16543@oz.plymouth.edu>
Source record: 227129

Going on the assumption that MiNT is a UNIX look alike OS, what others are there for the ST. If I am wrong, please correct me. I'm hesitant to get involved with MiNT because I've got a good deal of money involved in what I consider strictly GEM applications and software. I really like NEODESK, but I also like UNIX (and in fact on a per hour basis use UNIX much more, my Atari's main use is to connect to the school computer with Flash). So I guess I'm looking for info that could help my decision:

What exactly is MiNT? Is it a whole new OS, if so how much memory do you need/does it use up? I've only got a Meg and the future doesn't look bright for getting more right away.

How good is it? I use Ultrix 4.2 with TCSH on the school computer and have grown very attached to it. I also find the differences between it and TOS great enough so as to avoid confusion.

What happens to all my old GEM programs? Can I switch between TOS and MiNT at my own will (and easily) or do I end up reformatting my hard drive whenever I wish to change OS?

I have been using GULAM for a CLI so I can use Sozobon C, I am quite impressed with it, though I find it limiting sometimes. Am I going to make any significant gains with MiNT that would justify such a drastic change? I enjoy the flexibility of a windowed OS for file exchanges and bopping around between programs, and then being able to use GULAM to keep the fingers in shape for typing long messages like this. I also run SuperCharger are there any conflicts here?

Is MiNT multitasking? I assume not with only a Meg of memory, but thought I'd ask. If it is multitasking what are the possibilities of getting a dumb terminal (vt100) and lnking it to the RS232 port to allow two users on the ST?

I guess that about covers it, thanks to any who reply in advance, please send E-mail.

Stephan

135. Re: High Density Drive via ATSpeed

Newsgroup: comp.sys.atari.st
Date: 1992-01-08 00:47:49 UTC
From: ytsuji@cfi.waseda.ac.jp
Message-ID: <2046@wsdnws.waseda.ac.jp>
Source record: 227128

High density drives usually require double the scanning speed of the
floppy disk controller chip. If your Atari is equipped with this, ATSpeed
should not have trouble handling them.
However, if your high density mode is dependent on softwarewise switch
over, I am afraid ATSpeed is unlikely to handle your high desinsity stuff.
(If you have installed a TT compatible PLD or something, you might have
a chance).
I used a manual switch on the 5.1/4" drive that eventually switched on the
high density mode. This method is best in that it requires no software.
Tsuji

> And here in America, a Honda Civic costs only $7000, but a BMW 325i costs
> $28000!

> Another big rip off..!!!

Bad example of a rip off, I think. Every European car has a special
US-export model which is almost fully loaded with extras. If you have
to pay $28000 for a 325i in America, you are lucky. With same extras
you have to pay much more for one in Europe, because all those extras
are order only in Europe.
And think about us people in Finland, we have a car-tax about 100%,
and we have to pay that $28000 for a base-model '92 WV Golf 1.8...
With that money you will get a fully loaded Golf VR6 over there...

Please follow up to a car-oriented newsgroup, will you?

The fm modulator does too have something to do with the composite video.
It is the reason the ST has it. Part of the modulators function is to offer
support for composite video.

Source record: 227140

I have a Mega STe and was hoping to be able to run Falcon on it. A local dealer ordered it for me and ran it on their Mega STe with no success. They said they were having a hard time getting the Mega to boot from floppy. I advised that they try it on a 1040STe, since I've heard that most software that runs on a 1040STe will also run on a Mega STe. They tried that, and still no success. It was crashing when it asked for the second disk to be inserted into the drive. I have also been considering F-15 Strike Eagle II, and F-19 Stealth Fighter (I know they are basically the same in look and feel). Does anyone know if any of these will run on a Mega STe? The dealer said there was a possibility that there would be a patch for Falcon that would fix it to run on STe's. Does anyone know if such a thing exists?

E-mail me your replies to the address in my .sig, or mmiller@isis.cs.du.edu. Or post it here if you think there is enough interest.

By the way, does anyone know where I can get a comprehensive list of software titles for software that does or does not work on STe's? I have seen partial lists, but they rarely list software that I'm interested in.

Thank you in advance.

Best game?

Llamatron!!

Why?

It's most brainfrying action, totally absurd sound samples and sheer intensity.
As Minter said himself, Llamatron is the death metal of video games!
Also, it's shareware.

I have the new shareware game by Minter, Revenge of the Mutant Camels. At
least as good as the CBM64 original!

Gods was pretty good too though...

I'm also interested. But I have an application running on my Mega ST which uses the cartridge slot. It uses a cartridge as a 'dongle' - a security device. I assume I won't be able to run this application on the STBook - can anyone confirm this will be the case?

> matter), I'd appreciate information on that as well. Thank you.

You could try compiling the code from PDP VIII, I did and it worked for me.
The code in Byte (The "little red riding hood" example) provides a good
template for taking it further.

I'd also beware of saying things like "Speed doesn't matter" until you've
seen a computationally-intensive nn program actually running under PC Ditto.

BTW --- The "Neural Network Construction Set" demo on atari.archive doesn't
actually work. Halfway through the demo, the program throws up an alert box
which desynchronises the synthesised demo input and screws up the whole thing
thereafter (sigh).

>However, I still have some questions.
>
>One of my questions is why is there a need for ST RAM in these machines?
>
>Why can't they just have fastRAM?

The ST is just RAM which sits in the ST normal address space and can be used by the video circuitary. The main reason that it is slower than Fast RAM is that the processor has to wait for the video circuitary to get out the way when accessing it. On the SST, the ST RAM will also be slower cos the ST part of the machine will probably still be running at 8MHz and the RAM there is not the fastest types you can get either.

>
>It would be great if the TT/030 could use fastRAM only to run ST
>software.

I've found on my TT that most software which runs will run in TT ram.

>

>But why?

The hardware can only access RAM in the ST's normal address range, blame the DMA and MMU chips in the ST.

Yes, you are right, an emulator is an interpreter.

>Instead of simply executing the 68000 instructions as the IBM program
>is scanned, why not store them for later running at full speed..?
>
>I understand the difficulties involved with data being mixed into the
>program, but how then does an emulator handle it..?
>

The emulator interprets the instructions at runtime. It simulates an
8088 (or whatever). Of course you could write the substituted
68000-instructions into an executable file, but what to do if there is
a conditional statement in the program-code? An emulator just has to
decide between `true' or `false' and eventually set it's simulated
program-conter to the new address. The converting-program would have
to follow both paths. But sometimes programs have undefined paths
which are never executed. And again, what do you do with indirect
addresses and indirect jumps. Often the indirect addressing-method is
used to address special hardware-registers or system-variables which
are guaranteed to be different on the ST. An emulator can catch access
to these addresses at runtime and simulate the desired action.

I think it is not impossible to write such a converting-program, but
it might only work with some special programs (which e.g. do not use
indirect programs and conditionals and loop, e.g. calculate 5+5 :-)
but it will fail on most programs.

Of course one could integrate an emulator into the program, so one
would just start one program, but not at any higher speed...:-)

As the developers of TurboC/PureC claimed at Duesseldorf in August the
compiler itself did not change in PureC. So I suppose it cannot.

But I know of the very old MEGAMAX C-compiler (not LASER C) that it
could, but I think it is not distributed any longer...

>in the external type such as Supercharger. Thanks.

If you're interested in a hardware add-on for the emulation, your best bet is probably an Amiga 2000/3000. They feature IBM style expansion slots in addition to the Amiga slots. Commodore sells something they call a bridgeboard which can be popped into one of these slots and shazam, you have a PC clone.

On the ST side, I haven't heard of a 386 add-on, though I don't suspect that it would be much more difficult to produce one than it is to make the 286 emulator. Actually, they are not emulators at all since they use an actual Intel chip to get the job done. Regarding VGA graphics, that might pose a problem since the ST isn't capable of VGA graphics resolutions (well, it can do the original VGA, but 800x600 and 1024x768 are the most common now) in native mode so how can you emulate it?

With the price of 286/386sx laptops falling rapidly, you might be better served if you buy one of those instead of trying to kludge one up on your ST.

Whether or not, this applies to the TT, I don't know since I haven't been following the TT very closely. I'm sure someone who does know will comment.

Cheers,

Chris

Good luck trying to find a freebie neural net program. I don't think you'll have much luck. On the PC side there are a few programs available that are software only which range in price from $100-1000. I even saw a package for about $200 that ran a neural net based on Excel spreadsheets. Whether or not any of this stuff works on PC Ditto, I have no idea. When I had an ST, I had PC Ditto and found it to be quite compatible, but VERY slow.

Regards,

Chris

The original Megamax C compiler (I believe ver. 1.1) generated PC-relative code. This was the pre-Laser C compiler. There were lots of 32K restrictions in the generated code though, of course, although they had a scheme where you could explicitly force a long jump or something into a certain module. I doubt you could still buy a copy, you would probably have to get a used one somewhere.

165. New Heat & Serve C compiler

Newsgroup: comp.sys.atari.st
Date: 1992-01-08 18:39:10 UTC
From: steve@thelake.mn.org
Message-ID: <A1692735528@thelake.mn.org>
Source record: 227010
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

If you peek in comp.binaries.atari.st, you'll see that Ian Lepore's
``Heat and Serve'' version of Sozobon C is beginning to move across
the network.

This version is especially good for beginners and anyone interested
in running the compiler directly from the GEM Desktop.

It's been tested fairly extensively on STs, but not at all on TTs.

We received one vague report of a problem with INSTALL.PRG, the
automatic installation/configuration program, from a TT user who
is a GEnie sysop. If any TT users could elaborate on this, please send
a note to me and/or Mike Dorman <MDORMAN1@UA1VM.UA.EDU> so it can
be forwarded to Lepore.

167. WANTED: Atari ST power supplies

Newsgroup: comp.sys.atari.st
Date: 1992-01-08 18:42:34 UTC
From: steve@thelake.mn.org
Message-ID: <A1699813416@thelake.mn.org>
Source record: 227011
Cross-posted to: comp.sys.atari.st,misc.forsale.computers,misc.wanted

I'm looking for a (cheap!) replacement power supply for an old-style
520ST (external black power brick) and an internal power supply for
a 520STFM.

I'm running thelake on borrowed electrons, and I have to give them
back. :-)

If you have a spare or know of a cheaper source than Best Electronics,
please send me a note via email.

Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech,comp.sys.mac

Can an Atari 1224 color monitor be used on a Macintosh LC? Please email
or post answers and I'll summarize.

Gary Trimble

169. Greek GDOS Fonts?

Newsgroup: comp.sys.atari.st
Date: 1992-01-08 20:33:41 UTC
From: rws@dstos3.dsto.oz.au
Message-ID: <1992Jan8.143341.163770@dstos3.dsto.oz.au>
Source record: 227136

Any body out there have Greek GDOS fonts suitable for mono screen and 24 pin epson printer? Ancient and modern greek would be fantastic.

Thanks in advance,

Russell.

I have one. It demonstrates by recognizing pictures that are damaged,
restoring them, visible on the screen.
I asked for the software and got it with the sources (in C), after
seeing a demonstration at the laboratory were I was working.
I was made by someone at the University of Utrecht (the Netherlands).
If I remember well, I have three disks in my box about it.

Yes, that is right!

Does it still hangup before it dials and such? What I am wondering, is,
would it be possible for me to UUCP over a packet switching network onto
my unix box? Before it was impossible because of the way it dialed.

173. 1040st or mega st

Newsgroup: comp.sys.atari.st
Date: 1992-01-08 21:48:19 UTC
From: meehan@en.ecn.purdue.edu
Message-ID: <1992Jan8.214819.2878@en.ecn.purdue.edu>
Source record: 227098
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Hi all,
I am looking to buy a 1040 st or a mega st, and need to know some things:

{1} would I be able to use the diskdrive, monitor, mouse, and printer
from my old 520st (I don't know model #s, but they are from the first
year or two of the 520's existence)

{2} Will the software run from my old 520 st
on the 1040 st's or mega's

{3} Is there a difference between the different lines (1040STFM and 1040STe and
whatever else there is...)

{4} Please also include anything that you think may help me in my decision.
(I will be using the computer to play/write video games...
Dungeon master type stuff...
- and - writing some C++ application programs.)

Thank you in advance...
Mike Meehan meehan@en.ecn.purdue.edu

As far as I know, the latest version 3.6 of GFA-BASIC claims to be fully
TT compatible. Perhaps anybody should try to compile the UUCICO Basic
source with this version, it could only get better...

But I'm afraid that this is not the only problem. UUCICO uses e.g.
LINE-A routines that should be replaced for the TT.

179. Disk (drive?) problems...

Newsgroup: comp.sys.atari.st
Date: 1992-01-09 01:05:06 UTC
From: JJL101@psuvm.psu.edu
Message-ID: <92008.200506JJL101@psuvm.psu.edu>
Source record: 227023

I have been noticing with recurring frequency that a number of disk
are giving me error 'sometimes'. As follows: today I downloaded a number
programs on an IBM and brought them home to my 1040STfm, and also have a
supra hard drive. I tried copying the files to the HD but it gave a
cancel retry disk error. I then rebooted and tried again and it was fine.
This happened a couple different in somewhat similiar ways. I then went
to reformat a couple other disks with dcformat and verify on. It formatted
then before it eve started verifying track one (after formatting all 80 tracks)
it gave me a disk error. I formatted then with the normal tos 1.4 menu format
and it went fine, then again reformatted with dcformat skewed and it was
fine this time also! very strange... not just 1 or 2 disks but differing
disks.
I cannot tell if this is a number of my disks are growing old... or
a roblem with my internal drive. Any hints on how to check such a sporadic
problem?

Actually, to tell you the truth, the 8088 doesn't know the difference
between code and data. It trusts you to tell it at what address to
start executing instructions. If you happen to tell it an address
that contains data instead of code, it will try to execute the data.
There are standards built into DOS which basically say that after the
loader is done bringing a program into memory, the processor is
instructed to start executing at the first address in the program.

Many times you will see some sort of JMP instruction in the first address of 8088 code. This allows the programmer to put as much data as she wants after the JMP instruction without fear that the processor will try to execute it.

As Mathew mentioned above, if you try to "compile" the 8088 code into 68000 code, you would have to take all possible paths through the code to accomplish your "compilation." Even assuming that this was possible, you still might not arrive at a correct translation. Many times a programmer will use a conditional branch in her program with full knowledge that one of the conditions that might trigger the branch will never actually occur. Your "compiler" wouldn't be privy to this insider information, and thus would generate a path for the condition that will never occur. What would your "compiler" be using to generate this erroneous path? Either valid code that should have been used to generate some other path, or data which could lead to more and more erroneous paths.

181. ST520 power supply source

Newsgroup: comp.sys.atari.st
Date: 1992-01-09 01:20:49 UTC
From: sytang@lamar.ColoState.EDU
Message-ID: <1992Jan09.012049.46318@yuma.ACNS.ColoState.EDU>
Source record: 227024

Someone asked for ST520 external power supply source, since this might be interest to ST520 owner I'll pass following information here.
I've no connection with the company mentioned below except purchased once from them and no trouble.
In recent issuse of Volts and Nuts, a company in CA called HSC has a power supply listed for $14.95 with a picture looks like a ST power supply and has DIN-7 connector, +5V@3A, +12V@30mA and -12V@30mA. The DIN-7 is female connector .
Judge from the spec. it's identical to ST520 power supply, the HSC number is 12800, and the phone number is 1-800-442-5833.

Ask them before you order, they will tell you exactly what it is.
Standard disclaim apply.

182. MiNT, Spectre (2.x), Tcsh, BMS 100, TOS 1.4, Trackball...

Newsgroup: comp.sys.atari.st
Date: 1992-01-09 01:51:30 UTC
From: mowgli@magnus.acs.ohio-state.edu
Message-ID: <1992Jan9.015130.23999@magnus.acs.ohio-state.edu>
Source record: 227025

Yup, I included a lot of stuff in the title. I figured I'd stick it all into 1 article. :) Anyhow, right now I'm using a stock ST520, TOS 1.0, 2.5Mb of RAM, BMS-100 hard drive boards with a ST 251-1 40Mb drive & a 15Mb IMI drive (which is itself a problem :). In no particular order, the questions I have are :

1) MiNT is a rather strange animal. I suspect the fact that I'm using TOS 1.0 has something to do with it (see another question below :), but whenever I try to run MGR, it comes up (nice opening graphic, BTW) & after I try to do something on the menu, dies (hangs). Running things under MiNT seem to work OK, but it's of relatively little use to me if I can't get MGR to behave. I got this from the UMich archives, & the MGR is from the file atarimgr.zoo.

2) Tcsh bombs frequently if I'm not running MiNT, though I did see in the readme that it's not under warranty if you're not running MiNT. :(But, from using the stock login.rc, logout.rc, etc. I can't get Tcsh to DO anything that should be a built-in. ls(1) always comes back with 'command not found', & of course dir isn't there either (though since it's from Unix, it's not supposed to be :). I haven't looked into this problem in detail yet, so I might be missing something simple.

3) I just picked up the TOS 1.4 ROMs (set of 6), & am wondering if I can just plug them into the sockets for the old TOS 1.0 ROMs (set of 6)? A friend of mine said I should be able to, but the instructions in the packet are VERY confusing & seem to hint that I need to cross a couple of jumpers or some-such on the motherboard. Unfortunately, on my Rev. B MB these jumpers aren't labelled.

4) I've attempted to add a 15Mb hard drive (the IMI wonder :) to my 40Mb setup. Using the BMS Utilities, everything is hunky-dory, UNTIL I go into Spectre & attempt to format one of the partitions on the 15Mb drive for it. This partition suddenly & irrevocably disappears! After I reboot, both GEMDOS & Spectre haven't heard of it, & Spectre complains that the hard drive setup doesn't jive with the saved setup. My Spectre GCR version appears to be 2.x, I believe. The partitions I tried to set up are :

```
Drive Size Type ID Problem/Notes
---------------------------------------------------------------
40Mb 10Mb GEMDOS C None
10Mb GEMDOS D None
4Mb Spectre - Note that GEMDOS doesn't give
this drive an ID letter.
16Mb Spectre - Also not recognized by GEMDOS.
15Mb 5Mb GEMDOS E None
10Mb Spectre This is the partition that
always seems to disappear.
```

5) A friend of mine just got one of those old atari 8-bit trackballs. He'd like to use it on his ST, but found out it's not just plug-n-play. He said he remembered there was an article somewhere about how to convert the trackball to the ST. Could someone please mail me a copy of the article, or instructions on how to do this?

Thanks a lot! <Mowgli>

184. Help me appraise my ST!

Newsgroup: comp.sys.atari.st
Date: 1992-01-09 03:30:13 UTC
From: wcsanil@superior.carleton.ca
Message-ID: <1992Jan9.033013.803@cunews.carleton.ca>
Source record: 227027

Well, I'm soon going to be abandoning Atari in favour of more stable
and powerful computing waters, and I was wondering if you ST experts can
tell me what I can reasonably expect for the following ST system (it's
used of course, but in excellent condition):

520STfm w/DSDD drive (unexpanded)
SF124 SS drive
SM124 monochrome drive
GVC 2400 baud modem w/cable
tons of manuals, disks and boxes

What do you think? $5000? $1000? $500? $50? $5? $0.05?

By the way, I'm in Canada, which means ST prices are generally quite a
bit higher than they are in the States.

Any ideas, tips etc.. are appreciated.

Heck, if you're interested in the system itself and want to pay for
shipping, I can do that too..

Thanks,

Anil Prasad

Hi,
I own a STE and i have no problems with FALCON. Still though, i used to have
a problem when i had an extra diskdrive connected to the machine.
It's a roctec that took it's power from the joystick port, so i had to
disconnect it, then it worked. Maybe this will help??

Jack

191. Re: Word Perfect 5.1 on PC ditto

Source record: 227034

I have not tried it with Ditto but I know that there is something
wrong with WP 5.1 as it does not run under VP/ix (that is
dos-emulator under DOS). WP 5.0 works OK, so you should try it.

Here is a transcript of an interactive conference Wednesday night
on GEnie.

==========
(C) 1992 by Atari Corporation, GEnie, and the Atari Roundtables. May
be reprinted only with this notice intact. The Atari Roundtables on GEnie
are *official* information services of Atari Corporation.

To sign up for GEnie service, call (with modem) 800-638-8369. Upon
connection type HHH (RETURN after that). Wait for the U#= prompt.
Type XJM11877,GEnie and hit RETURN. The system will prompt you for your
information.
==========

January 8, 1992

<[Sysop] JEFF.W>
Bill Rehbock has a special announcement to share with us.

<[Bill@Atari] B.REHBOCK>
Thank you, Jeff.

Ahem... I have an official announcement to make. I will take a few
questions afterward.

Greg Pratt has taken a job with Creative Labs, the company that
produces "Sound Blaser Pro".

Everything is under control.

It was an offer that he could not refuse. It is a very amicable
parting, and we at Atari will be keeping in close touch with him. Don
Mandell will continue to supervise the sales organization. The
consolidation of the U.S. accounting with corporate (same as it was in
1985) had been planned with the assistance of Greg; marketing is being
handled by James Grunke, Art Morgan, and myself (working directly under
Sam Tramiel, as we have been). It will work out quite well, and we wish
the best of luck to Greg.

A complete press release will be uploaded by the end of the week.

(For those who aren't aware, Greg was the General Manager of Atari
U.S.)

<[Sysop] JEFF.W>
If anyone has any questions for Bill about this announcement, please
type /RAI to let me know.

<[John Cole] J.COLE18>
Bill, I really dont know how to take this news!

Since I am a User Group President, and currently trying to put together a new Dealership, I would like to know how this will effect our application and availabilty of prouduct to the US?

<[Bill@Atari] B.REHBOCK>
I assure you that it will not affect anything at all. We are in the process of interviewing people for developer support and marketing positions right now, building for a big 1992.

There definitely shouldn't be any product shortage problems, and there will be no problem signing up new dealerships. Don and Mike Groh have everything quite together on the sales side of things.

<NEVIN-S>
Hello Bill. This is very sad news...

I wondered if Atari will be looking for a new person to fill Greg's position, or if it will be filled by one of the Tramiels?

<[Bill@Atari] B.REHBOCK>
This actually had been planned for a little while now. We don't intend to replace him in the foreseeable future.

I guess our leaks are just stopped up better lately :-)

(Job 14)<NEVIN-S>
Thanks, Bill. No other questions.

<R.GRIFFITH10>
why does the TT High density drive format disks that aren't made for high density (no second notch) is there no checking mechanism? or is it just my system?

<[Bill@Atari] B.REHBOCK>
Well, this was supposed to pertain to Greg's departure but... just this one. :-)

I don't believe it is just your system. Atari owners are generally intelligent and know if the disk they are formatting is HD or not. If they wish to attempt to format disks at 11 sectors per track, with 82 tracks, we don't want to get in their way. :-)

Actually, I am pretty sure that the original design of the floppy stuff did not allow for the HD detect line. I could be mistaken, but I'm fairly sure that is the case.

<[What amazes] A.BAIER>
Why do people vanish as soon as something good starts to happen at ATARI? There must be brighter lights over the horizon.. I am not surprised at all..Greg has been doing some noticebly great things CEPS..Chicago Show..I guess that others in the computer industry recognize and reward greatness.

)<[Bill@Atari] B.REHBOCK>
The design of the marketing strategy build-up of 1991 was done by James Grunke, Art Morgan, and myself, under the blessing of Sam and Greg. I assure you that we are still here and these things are going to continue in a big way.

You will be seeing more advertising following the initial Music things that are happening, and Atari will become more visible in general as the year goes on.

<[Baaad Dot] D.A.BRUMLEVE>
Greg Pratt gave such a cute speech in Chicago. Will any of the promises and plans he discussed now become null and void? And if you are not going to replace him, who will give the next such speech?

<[Bill@Atari] B.REHBOCK>
The promises are happening, nothing is null & void. Depending on the issues being covered, I assure you that James, I, or Bob will always be in close contact with the users.

(James and I do a pretty good stand-up act :-)

<[JCD] MAG.SOFTWARE>
I'd first like to extend best wishes to Greg from all of us here at Magnum Technologies (formerly Magnum Software).

I think all of us here would like to know what type of advertising Atari plans to do this year. I have yet to see a TV commercial or hear a radio spot for Atari computers.

<[Bill@Atari] B.REHBOCK>
The majority of advertising will be print ad. We are considering putting together TV spots that would be placed locally, but I doubt that they would be launched before the fall buying season. We are finishing the first of the print stuff right now, and I hope to see it myself quite soon.

<[Brian] B.GOCKLEY>
Since Greg was theoretically pinch hitting for Alwin/Elie, it seems odd that little, if any, progress been made up till now on finding someone to relieve him?

I would think that Atari could really use someone powerful and dynamic at the helm (to match the sterling workers in the trenches) to work under/with/against/around the Tramiels. Or is the GM position just a figurehead? (And is there anyplace special we should keep an eye on where Atari will get more visible?)

<[Bill@Atari] B.REHBOCK>
As I have said, the progress that had been made _was_ a team effort - big time!

<[Jim] KC-IN-2000>
What do you mean by a big 1992 and where should we expect to see print ads?

<[Bill@Atari] B.REHBOCK>
The placement schedule is not finished being worked out yet. It will be where you'd expect them. (Music, DTP, etc.)

<DOUG.W>
It's been noted many times that the success of the non-U.S. subsidiaries is largely due to their "distance" from the Tramiels.

Based on these observations, won't this "combining" of Atari Corp. and Atari U.S. be detrimental to the success of Atari U.S.?

(BTW, I would *expect* print ads in Time, Business Week, Scientific American, etc.)

<[Bill@Atari] B.REHBOCK>
In 1985, when Atari had their big wind-up, U.S. & Corporate _were_ run as one. There were far fewer communication problems than there had been after they were separated. Phones and faxes make subsidiares suprising close! All product allocation, etc. for the world has always been done from here, so that has not been their biggest advantage.

(suprisingly)

<OFFY>
What Atari products will be addressed in these print ads? Is it Atari's hope to bring about increased hardware sales and software productivity to the U.S.? Finally, will these print ads be directed toward any new markets?

<[Bill@Atari] B.REHBOCK>
Yes, and yes.

<[Bill@Atari] B.REHBOCK>
Our definite intent will be to attract new users. Both from other platforms and those new to the computer buying market. (Education may play a large role also, dependent on how software accelerates.)

Thank you very much for your time, as I have said, this is not a big deal for us, and the plans and systems are in place (as are the plan-makers:-). Have a good evening!

<[Sysop] JEFF.W>
Please wish Greg Pratt success and good health in his new position. He's made a lot of friends in his tenure at Atari and he will be missed.

<[Bill@Atari] B.REHBOCK>
Thank you!

193. The Atari revolving door

Newsgroup: comp.sys.atari.st
Date: 1992-01-09 08:56:05 UTC
From: Bob_BobR_Retelle@cup.portal.com
Message-ID: <52570@cup.portal.com>
Source record: 227039

The revolving door at Atari has reached higher than ever today...

Greg Pratt, who has been with Atari for years, and who has done a great deal in recent months to stablize the company, has left to join Creative Labs, producer of the Soundblaster board for IBM systems.

No one has been named to take his place, leaving (God help us all), Sam Tramiel to take over his duties as General Manager.

BobR

I had the C64 original, and always wondered what the title music was
called. I know it wasn't written specially, because I later saw the same
tune used in a repeat of "The Two Ronnies" TV show from the mid 1970s.
Does anyone know?

Good old Megamax C (not Laser C) did this. As a result the programs could not have any segments more than 32K. I'm pretty sure this was the case because the executables produced had no relocation tables.

[Note: those of you who already have Unnkulian Unventure II should get the newly-released version 2.0 of the game. It fixes lots of annoying bugs in earlier versions.

This article is posted periodically.

Archive site administrators: Please replace any older versions of the games you might have with the new ones if possible. Thanks!]

The Unnkulian Unventure Series
Interactive Fiction for the 90's

Remember the good old days, when adventure games challenged you with great puzzles and evocative descriptions without resorting to using any graphics at all? We really miss Infocom's emphasis on gameplay rather than glitz, so we've decided to write our own adventure games along the lines of those Infocoms we liked so much.

If you're looking for top-quality interactive fiction comparable to Infocom's commercial offerings, check out the Unnkulian Unventure series of games, shareware text adventures available from an archive site near you!

In _Unnkulian Underworld: The Unknown Unventure_ you play the part of Kuulest's slave, and must recover the Orb of Studosity from the evil Unnkulians. Kuulest, the old geezebag, has died and left you with nothing to go on but a cryptic message about saving the planet. You'll encounter amazing Acme products, the infamous Guardian, those witty creatures known as Drolls, a giant beaver, and even the Unnkulian Warrior. <Gasp!>

In _Unnkulian Unventure II: The Secret of Acme_ your adventure continues as you try to create some good press for yourself -- wouldn't want to fade into anonymous obscurity, now would you? Along the way, you'll find the answers to these compelling questions, and more:

o What happened to the Unnkulians?
o Why are Acme products so bad?
o What is this cheez stuff, really?

Plus, you'll get to explore Dawg Rock, a Duhdhist Retreat, Acme's clandestine prototypes laboratory, and even pay a visit to Acme HQ.

The Unnkulian Unventure games have already gotten rave reviews from numerous Infocom addicts and other adventure game connoisseurs, so why

not give them a try?

The games are available for FTP:

PC and compatibles:
----

msdos.archive.umich.edu:

msdos/games/textadv/unnkul12.arc
msdos/games/textadv/unnk2v20.zip

NOTE: Newly uploaded files reside in msdos/UPLOADS.
Look there first for the latest version.

Mac:
---

mac.archive.umich.edu:

mac/games/adventure/unnkulian1.03.sit.hqx
mac/games/adventure/unnkuliantwo2.0.sit.hqx

Atari ST:
----

atari.archive.umich.edu:

atari/games/tads/unnkul12.arc
atari/games/tads/unnk2v20.arc

(Sorry, there's no Amiga or Unix version at the moment...)

Both games are shareware ($10 registration fee for each) -- registering
gets you maps and hints sheets from the authors. Support us and you'll
continue to see fun text adventures like these that fill the void left
by Infocom's disappearance.

Questions and comments are welcome!

Dave Baggett

I would say this is _definitely_ an area (both ST and PC) where a lot of money
is to be made - the software with the Miracle System is quite good, but the
keyboard they force you to buy is lousy. If someone wrote equivalent software
but allowed you to use/buy your own MIDI keyboard I bet it'd sell very well.

I believe it's called 'Egyptian Ballet' (or something similar), and is one of
the main reasons I bought a C64.

The only reason my 64 is used now is for playing REVS...

>I would go about arranging this on my system.

Sounds like a good hardware basis to install GCC. Since I have already
got some requests of this type, I have made a complete doc while
installing GCC on my computer. It can be obtained via anonymous FTP:

Server: Tupac-Amaru.Informatik.RWTH-Aachen.DE
File: /pub/atari/gnu/installing

The file describes how I installed GCC, G++, gnumake and some other
utilities. The files needed are on that server, but these are the same
as those found on atari.archive.umich.edu (and probably other sites), so
you should get the GCC distribution from the nearest possible site.

>--
> John Richards

Not true, actually; the expansion port includes _*ALL*_ of the
cratridge port signals (I should know; I designed it). An enterprising third
party (I'll tell you who as soon as Bill Rehbock tells me) will make a small
convertor consisting of two (2) connectors and a PC board (and plastic, I
assume). I _have_ built a hack which does this for testing purposes, and it
works fine.

The reason we (Atari) aren't doing it is that, after all of the
documentation, tooling, assembly, etc we would have to do, we would end up
having to charge far too much. It makes a near-ideal small third-party product.

Incidently, we _*STRONGLY*_ recommend that future software products
use the industry-standard _PARALLEL PORT_ dongles, which would save you having
to re-invent security algorithms, etc. Using the cartridge port for such
things is not a particularly good engineering practice, and forces us to
maintain an "old-technology" port for a long time.

I had the same problem before but I put the 2nd disk into the second drive and it work fine. Unless the 2nd drive is a 5 1/4' then it has to be disconnected.

>Any clues on how to do better?
>

Well, some small hints that immediately pop to mind are:

make use of the pause icon often
put the information shield on the enemy leader, and check his
position often
Knights are really only useful when you are kicking the shit out
of the enemy (and want some burning buildings to look at).
As strong leader is just as good in a fight, and can be
positionally controlled with the ankh statue.
It is important in the later games to constantly pester the enemy
with small disasters, to restrict his power growth. If you
do not, you will find yourself besieged with volcanos, swamps,
etc.
The quickest way to recover from a volcano in your territory is to
earthquake it.
For "build on people" worlds, get some energy together, stick your
ankh in enemy territory, and raise huge mountains when the
leader shows up. Kind of like "super volcanos".

One big help is to develop the "fast" method of flattening land. Pull up a
point twice, then lower it once. This will flatten four squares at once
(at the cost of more energy). Often getting flat land is more important than
conserving energy. This techique works in reverse for lowering land.

I am looking for a PD or inexpensive tool for the ST
to transfer midi sysex dumps from my Quadraverb GT.
Is there somthing generic out there for just program
dumps from a unit to disk and back?

Also am looking for PD or inexpensive keyboard tutor
program (ie interval trainer ear trainer almost anything)

Thank You
Max Newman

212. letter invaders game recently posted to comp.sources.unix

Newsgroup: comp.sys.atari.st
Date: 1992-01-09 22:10:52 UTC
From: georgew@tekig1.PEN.TEK.COM
Message-ID: <4097@tekig7.MAP.TEK.COM>
Source record: 226954

Letters, the "Letter Invader Game", was recently posted to comp.sources.unix.
It's got Amiga ifdefs in it, but I don't know how to go about porting it to
an ST. (I've got a compiler, but no termcap library, and very little
experience actually programming the ST.)

Has anybody tried porting it? Or has the original PC version already
been ported to the ST? For information, here's a summary from what the
author posted:

```
-From: lm03_cif@uhura.cc.rochester.edu (Larry Moss)
-Newsgroups: comp.sources.unix
-Subject: v25i090: letters - game to improve typing skills
-Posting-Number: Volume 25, Issue 90
-Archive-Name: letters
-
-Here is "letters", the "Letter Invader" game. It is pretty cute. It is less
-stressful than Tetris, but it might be a good diversion while waiting
-for something to compile.
-
-Abstract (lifted from the man page):
-
- Letters is based on Letter Invaders which was around in the
- PC environment several years ago. It in turn was based on
- the popular arcade style game, Space Invaders. For those
- not familiar with Space Invaders (please let me know if
- you're one of these people and let me know what planet
- you've been living on :-) the idea is to blast aliens out of
- the sky as they attempt to land on and "kill" you. Since
- this is a game to improve typing skills, the aliens are
- words selected randomly from the dictionary. You blast the
- aliens out of the sky by typing them correctly.
```

Hi,

Robert Delius Royar wrote:
>Can someone give some details about the (long awaited) STBook? Specifically,
> 1. What comparison to ST/STE/MEGA (is it one or the other?)?

You can compare it to a "normal" ST with 8 MHz, but the latest TOS-Release
(2.06).

> 2. What internal storage media (floppy/hd)?

40 MB IDE-HD, No Floppy, but Atari will release an external drive to connect
with the STbook.

> 3. What kind of screen refresh slow/medium/fast?

Dunno. The LCD-Display is non-comparable to a "normal" screen.

> 4. What expandability (I know there is a (kind of) direct
> line to the CPU to replace the old cartridge slot, but
> what else?

There is a serial and a parallel port, the DMA port and the two MIDI ports.
There is an extended Mega-Bus on the left side, like the Cardridge-port on
the ST. Finally, there is space left for later expansions like an inbuilt
Modem.

> 5. What memory configurations and how is memory added?

1 MB, but i have heard of a 4 MB-STbook.

> 6. What TOS level does it run?

TOS Release 2.06, the latest release with the new Desktop.

> 7. Has anyone seen one of these yet?

Nope, just at the Atari-Show at Duesseldorf, Germany in October 91.

> 8. Where can I find a complete review?

In the German magazines "ST Magazin" and "ST Computer".

219. PC Ditto II and Mega ST. HELP!!

Newsgroup: comp.sys.atari.st
Date: 1992-01-10 07:33:03 UTC
From: i9853100@uavax0.ccit.arizona.edu
Message-ID: <1992Jan10.003303.1@uavax0.ccit.arizona.edu>
Source record: 226966
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I have a PC Ditto II doard that works fine on My 1040 ST, but does not
work properly on my Mega ST. I am sure that it was connected properly to the
Mega. It would boot DOS and then would always crash very shortly thereafter.
Later, I noticed that If I try to turn on the Blitter from the desktop (
before even running the PC ditto software) the computer instantly hangs.
If I disconnect the PC Ditto, things are normal.
Does anybody have any ideas as to what the problem is? Was the PC Ditto II
known to have problems with the Megas? I am not sure if the board has the
updated PALs or not. Does anybody know the part numbers of the replacements>
Any help would be appreciated!

Dunno? I think the game is unfair. When water is harmful, ie. prolonged
exposure causes death, and there is a flood the computer just scans the map
array and instantly puts a small piece of land under as many of its people
that it has energy/mana to do so. No human player could do that.

It is not impossible to make a cross compiler for intel
CPU's, when self modifying code is not used. There is a
packet called XDOS running under UNIX, which analyses the program
and creates a UNIX (680x0, ?) runable version. But there is a
runtime package and a compile package.
The compiler does a full dataflowanalyses using several HOURS on
a SUN. Fortunately this us to be done only once. From the analyse
results the compiler builds the UNIX code.
How they handle grafics . ?????????
I think there is a big optimizer included.

But this is just science fiction for most of us, since a PC is much
cheaper than the software.

I think the files that are not extractable with older versions of
lharc are compressed with method -lh5-, which was introduced in lharc
version 2.0 and above. There is a mini version of lharc which can handle
-lh0- (stored) and -lh5- but not -lh1-, that is written in ANSI-C (I think).

It is called AR and propably available somewhere. If someone doesn't find
it anywhere I might send it to you.

>ATSpeed...via Windows 3.x. I should say, however, that
>I've never really tried to use expanded memory... There are software
>expanded memory emulators, but I understand they are slow.

The play I had with TC power with PC speed did show up a few problems.

TC power allows you to configure memory or disk space on an AT as extended memory for the PC.
However when using PC speed the only way to get TC power to recognise your extra ST memory is to make it into a RAM disk and allocate this as a disk to use as extended memory with TC power. THIS MEANS that you cannot allocate another disk to TC power for more 'slow' disk extended memory so if you want more memory that you have you can't have some in real memory and some on disk.
With regard to the use of TC power with AT speed the AT should have the ability to address the additional memory dirrectly but I know that the instructions which go with supercharger tell you to configure a ram disk and use it as described above.
I suggest that when you buy TC power you make sure that it allows you to use BOTH your memory and disk at the same time with an AT speed.

P.S. I agree with the 'go for it' attitude, PC speed is fantastic value for money and is a very good PC clone, if you must run windows the go for AT speed (even a 16MHz version if you can afford it)

I suppose I should really qualify that: It seems like Megamax C
could have been made to handle 64K segments, but they _chose_ to
restrict segements to 32K. It's all because the Megamax compiler was
ported from the Macintosh, which has such restrictions for other
reasons.

Can you get anywhere in Revs? I have REVS + and it is HARD! Any tips?????

THe docs are also very complicated...hmmm, I think I better find them
for the keyboard layout...

Anyway, Attack of the Mutant camels was okay... But, the main reason
I bought my c64 was when my friend showed me Ghostbusters, Ways of the Exploding
Fist, and James Bond...I was sold!!!!!! (Beach Head II, another great one!)

233. Hard Drive Backup

Newsgroup: comp.sys.atari.st

Help!!!! My hard drive has gotten a few flaky spots on it and is in need of reformatting, but I have no backup software. Can anyone recommend any to me? I'd prefer PD, available through ftp; but will take recommendations on any and all software available. If it makes a difference I'm using a homebrew hard drive with an ICD Host Adaptor and a Maxtor LX-90 hard drive. I've tried using the ICD utilities shipped with the adaptor to rebuild the partitions (after shuffling all the data from one partition to another) but it gets so far and then stops and gives an error of sense code $FF then suggests reformatting. Any and all help will be greatly appreciated.

m(> intercept the TAB keypress.This would prevent the TAB from getting to

That won't work, I'm afraid. The result of an evnt_keybd() only gets passed
along to the application that owns the currently open topmost window. An
accessory slumbering in the background never notices this. You can however do
an evnt_multi with a timer of period of 250 milliseconds, and then check the
flags for the control/alternate/shift keys, but you still won't get any
information about "real" keys pressed.

From: maf4003@rigel.tamu.edu
Message-ID: <10JAN199213562487@rigel.tamu.edu>
Source record: 226983

Hi folks, I have a problem. I've used Cheetah 3 extensively for a while now without any problems but recently something has gone wrong. When I create a folder in a hard drive partition with Cheetah 3 then copy files into it with Cheetah everything seems okay....until I exit to desktop and try to access the files that I just copied. The folder shows up but when I open it it is empty and I can't delete the folder from desktop. I have to go back into Cheetah which shows all of the files that I had copied to into the folder! Then I can delete the folder from Cheetah. Wot's the danged deal?!?!!?
BTW: I'm using a 520stfm w/ 2.5megs and a supra 48meg hard-drive.

|>
|> Has anybody tried porting it? Or has the original PC version already
|> been ported to the ST? For information, here's a summary from what the

I have an almost working version, if you're interested. I liked the game
a whole lot, so I started with the Unix source and just did what was necessary
to make it work. I stripped out all the term cap stuff and just replaced it
with simple xbios stuff (Cconin (or some such thing) etc.) The version I
started with recorded the highest score for each user on the system. I
replaced this by the usual prompt for the name of whoever just got a new
high score. The version I have also makes sure two words don't overlap on
the same line. Finally, my hard drive died long ago, so I work from floppies
and ram disks. The original source fetched words from the dictionary one
at a time which is fine from a ram disk but completely unplayable from
floppy. So I fixed it to pre-fetch enough words for the current level, causing
the game to make a longer pause at the beginning of each new level.

The main problem is that when launched from the desktop, one has to type the
first word a couple of times before characters start to register. After that
it works fine. The problem is surely a simple one, but I really didn't want
to spend much time on it. When launched from a shell, everything is fine.

Anyway, if you want it, such as it is, let me know.

Cheers,

The problem is that Cheetah (among others) doesn't notify the OS of the changes it has made to the file-system so that when you exit from Cheetah the desktop can't see you have changed anything. The best thing for you to do to avoid trouble (and man, you can have REAL trouble if you try to write to the disk when the OS isn't "up to date") is to set "Reset at exit". That way you won't forget about it. It's the same with most older software that doesn't use the OS as intended. The only "low level" disk-mess-about program I know of that correctly updates the OS is Check-Disk from Atari.

> It's a roctec that took it's power from the joystick port, so i had to
> disconnect it, then it worked. Maybe this will help??
>
>
> Jack

Really?? Hmmm. This is interesting. What STe do you have (512K or 1MB)? What version of TOS? I assume you mean that it doesn't work if you have a hard drive hooked up? Is it alright to have a second floppy drive hooked up?

When you encountered your problems with it, what happened? As I said, when the dealer tried it on a 1040STe, which I'm pretty sure just had the internal floppy drive, it basically crashed when it prompted for the next disk to be inserted. He put in the second disk, clicked on OK, and it just came back with the prompt, and the disk drive light stayed on. One of the guys there WAS able to get it to run successfully (partially) on the Mega STe they had. They couldn't get it to boot from the floppy. They tried to run it from the desktop out of the AUTO folder. This only got so far, and then it crashed. I forget whether the guy said it actually loaded the second disk, and crashed during gameplay, or not.

The Mega STe they have at the store is a Mega 4/50, with internal hard drive, the kind that comes with most Mega STe's. I have a Mega 1 STe, so I don't have a hard drive yet. The next upgrade I will make to my system will be hard drive though.

In any case this was a disappointment. I have heard such good things about Falcon.

I've tried mailing to you, but it keeps bouncing. I read a post by someone else who said that when they just put the 2nd disk in the 2nd drive it worked. He said he had similar problems as the dealer was having (I think), before he found out how to do it. The problem I would have if this were the only way to run it is that I have only one floppy drive, and no hard drive.

I am still not quite clear on what needs to be done in order to get Falcon to run on my system. Do I need two floppy drives? Do I need a particular version of TOS (I have 2.05)? How much memory is needed? I have one Meg. and one double-sided drive.

Thanks guys!

245. DB9 cables for sale (joystick/mouse/etc)

Newsgroup: comp.sys.atari.st
Date: 1992-01-10 23:46:24 UTC
From: gpinzone@george.poly.edu
Message-ID: <9201102346.AA01540@george.poly.edu>
Source record: 226991

After a few years of building projects on the Atari and Amiga
line of computers, I would like to get rid of some joystick/mouse
cords I bought. Here's a list:

10 foot Atari/Commodore extension cables: contains ALL 9 wires for ANY
controller. Great to cut up for projects or use as a plain extension
cord! .....I paid: $6.00 - You pay: $3

3 foot ATARI(tm) joystick wires with +5V wire: These are original and
genuine Atari cables that have all the wires nessasary for a joystick
PLUS the +5V needed for projects, like rapid fire or to drive TTL
chips, etc. These also have built in strain reliefs, true color coded,
and clips at the end (just like the ones on all Atari joysticks), so they
are completely compatable with the Atari line of controllers.
.....I paid: $4.00 - You pay: $2

Atari/Commodore female plugs: these allow you to plug any Atari/Commodore
controller into whatever project you are building. They are the female
parts of the extension cords and are perfect for building a "mouse master"
or whatever. .....You pay: $.50

Minimum order $4, P&H is 75 cents. On orders over $10, postage is FREE.

Yours truly,

246. Current TOS version?

Newsgroup: comp.sys.atari.st
Date: 1992-01-11 01:26:03 UTC
From: cjd@zatch.Corp.Sun.COM
Message-ID: <8162@jethro.Corp.Sun.COM>
Source record: 226993

I am planning on resurrecting a rather old 520ST (yep, only 512K), but since I have very old ROM's in there I was curious as to the current level of TOS - the latest which will run on a 520, if that makes a difference; plus what's changed dramatically in the last few years...

I assume these are available from Atari? For a price; any ideas on what they charge for these things?

Thanks -
Chris Drake

248. Extensible Control Panel mystery

Newsgroup: comp.sys.atari.st
Date: 1992-01-11 07:34:37 UTC
From: mmiller@isis.cs.du.edu
Message-ID: <1992Jan11.073437.20801@mnemosyne.cs.du.edu>
Source record: 226997

While I like the Extensible Control Panel, I have noticed that it seems to lose its functionality whenever I run an application. Of the applications I have used where I can access it (Uniterm and Word Up), they all seem to disable most of the CPX's. I have a Mega 1 STe, and I have not added CPX's to the control panel, nor have I changed the minimum number of slots in the setup menu. But when I run Uniterm, for example, and I access it, all the CPX's seem to be there. When I double click on one of them, like General Setup, the disk whirs, and then nothing happens. When I reload the CPX's, I notice that only two or three are actually accessible. The problem is even worse when I run Word Up (only the Configure CPX's option is available). What causes this, and how can I correct it if possible? Do I need to make the CPX's memory-resident?

Yes Fully, the latest Atari monitors come from the same factory,
But Note: dot pitch could be 0.42 mm, not to good for 80 column
work..

See also Sozobon 1.33i, recently posted on the net. It's not an
official Sozobon release and was done by the GemFast guy, Ian Lempore
(sp?). I haven't tested 2.0 or 1.33i thoroughly but from what I could
see, 1.33i generates faster code.

253. UW - downloading problems

Newsgroup: comp.sys.atari.st
Date: 1992-01-11 14:26:55 UTC
From: dxper@dtek.chalmers.se
Message-ID: <8134@chalmers.se>
Source record: 226999

I have started to appreciate using Unix Windows on my ST when connected to Sun Sparcs. Unfourtunately I haven't been able to get kermit downloading to function correctly. Since that seems to be the only thing that might work, since it is the only protocol supported by the UW implementation I have and text capture won't work correctly I would like to know if someone has got this thing working. I suspect that it might be some simple configuration problem on the sparc side of the kermit thingy.

I'm connected via a modemserver over a network to the sparcs ...
(thus making a need for some sort of window scheme necessary in order to get downloading to work)

I'm using a version made/ported by Brad Bosch/Brian Katzung (no version number found).

Any help given would be appreciated greatly.

Yours,

pao

I have put a file called p_worlds.txt on atari.archive.umich.edu. This file lists out a bunch of the world names in Populous (they are the same names for the Promised Lands data disk, although the worlds themselves are of course different). If you find any errors in the file, or have any world names that are not in there, please update it.

Enjoy!

257. SST (68030) for the ST. 520ST?

Newsgroup: comp.sys.atari.st
Date: 1992-01-11 19:01:35 UTC
From: u1398@jsp.umontreal.ca
Message-ID: <1992Jan11.190135.10228@jsp.umontreal.ca>
Source record: 227053

I have been reading (Znet) about a 68030 upgrade called SST by David Small.
Sounds good, but can it be installed in a 520ST from 1985? Or does one need
a Mega ST, or a 1040ST, or one of the newer (>1988) machines like STE or up?

My 520ST has had a one meg Memory upgrade, so there's also less space inside.
Send a followup article please, as others may also want to know.

Hmmm... But some copy-programms copy a normaly Amiga-Formated disk without
problems. So, why should it not be possible to do it??

Perhaps you are right when you look at single sectors, but i think if i can
read track by track, that would be enough to build up a AmigaFS

From what I've read on GENIE, the SST will not fit in anything but a
Mega. IF you don't mind putting your ST in an AT case, then the SST
is electrically compatible with the old STs. AS of yesterday, the SSTs
were not shipping...

263. 1ST WORD PLUS TO WORD PERFECT 5.1/5.0 HELP NEEDED

Newsgroup: comp.sys.atari.st
Date: 1992-01-12 06:25:25 UTC
From: wcsanil@alfred.carleton.ca
Message-ID: <1992Jan12.062525.7356@cunews.carleton.ca>
Source record: 227061

Well folks, I'm abandoning the ST waters in favour of the more powerful and far more importantly -- stable waters of the 386 world.

I'd like to convert all of my 1st Word Plus files over the wordperfect 5.1 or 5.0 and was wondering if there is a program to do this?

If you have one, or know of one, *PLEASE* drop me a line via e-mail at wcsanil@ccs.carleton.ca.

Thanks.

It's such a good feeling to finally be leaving the world of Atari. I've had an Atari machine of one sort or another since 1981, I'll always remember Atari as the company with great machines but garbage support. Good riddance.

It is not posible to read Amiga Formated disks with the W.D. 1772, the track
read command is not reliable as the 1772 can get out of sync, go see
if you can do a track read of track 40 or 41 from memory, you will end up
getting carbage.

These are know bugs of the 1772 controler, as it can get triped out of sync..

Ahh ... I see that you're the next person to be hit by Cheetah. Many
people have used it in the past, and then found out that it has some
pretty nasty bugs in it, and have found that it is best to be put into
the "trashcan". If you use it, be very careful. It isn't a very stable
program, so use it with *EXTREME* caution.

From: JJL101@psuvm.psu.edu
Message-ID: <92012.162819JJL101@psuvm.psu.edu>
Source record: 227071

Will the source to sozobon 1.33i be released? I am very interested in
using this compared to 2.0 or 1.2(?), however, I am working with very large
(400k+) library files with a large number of modules in it. 2.0's link
will function properly , but 1.33i (and 1.2 without a small change), will
choke on such large libraries.
So does anyone out there know where the source can be had, if at all?

The .msa extention stands for Magic Shadow Archiver (MSA). It basically archives a whole disk to a file including the boot sector and is mainly used for those great selfbooting demos that take up an entire disk. MSA is the only way to copy those disks without having the disk itself. The only thing I don't like about unarching an .msa file is that you need a blank disk or a disk you don't mind erasing. It will format the disk for you (in the format of the original) and then proceed to recreate the original disk.

You can find a copy of Magic Shadow Archiver at atari.archive at:
archivers/msa_141.lzh.

You might also want to get:
utilities/whatis52.arc.

WhatIs is a great program by Bill Aycock that let's you identify what kind of file you have and tells you the program that uses it. Indespensible for just this kind of situation.
By the way, I believe zeppelin.msa is a collection of Led Zeppelin bites.

> they charge for these things?

TOS is up to 2.06 and 3.06 in the MegaSTE and TT respectively.
TOS 1.4 (also know as Rainbow TOS) is the most recent version that will
plug directly into your old 520 and is quite an improvement over TOS 1.0
(Though 'improvement' is relative for most). The visible changes include:
- New file selector
- Move files and folders with <Control> key
- Skip a file during copy
- Abort group copy, move and delete operations
- MS-DOS Compatible Floppy Disk formatting
- New copy disk<->disk utility
- Can change folder name
- Warm boot and Cold boot resets via key commands
- can install Auto-Boot application
- Install Application works correctly (You can reinstall applications)

Non Visible Changes include
- Much faster disk operation (hard disk too)
- the built in cache works (use cacheXXX.prg)
- essentially removed the 40 Folder bug (includes removed malloc bug)
- BIOS-devicedrivers now work through pointers behind the system variables
- The Clipboard routines work
... + many other bugs fixed

TOS 1.4 is sold at a retail price of $99 but can be found as low as $60
(you can install them yourself or have them installed.)

There may be *many* used sets of TOS 1.4 after the following:

CodeHead Software recently announced the TEC, a TOS Extension Card
developed by the german company Artifex, that allows you to plug TOS
2.06 into 520, 1040, and Mega STs. (Tos 2.06 will plug directly into
STEs). It's said to be compatible with any existing upgrades like
ram boards, 16mhz boards, etc.
TOS 2.06 is a *very* large improvement over TOS 1.4 even. The most
visible change is a new desktop, which contains features not much
unlike NeoDesk's plus a few more, yet it is all in ROM.

Some of the features of the TOS 2.06 desktop (from press release):
o Programs, files, and folders can be placed directly on the desktop and started with a double click.
o Up to 20 programs or documents can be assigned to the ST's function keys and started with a single keypress.
o Data files can be "dragged" and dropped on program files, which starts the program and automatically loads the document! Some programs even support multiple document files in this manner.
o Each file on your disk can have its own unique icon, or you can use a common icon type for each type of file. New icons can be created and added to the system.
o Keyboard commands for almost everything! And not only can you control the new desktop with the keyboard (as well as the mouse), you can also redefine any of the key commands to suit your own tastes!
o A powerful file search function, that lets you find and select files that match your specified criteria.
o Window management is considerably enhanced; scrolling has been sped up, and selected files can remain selected even if you scroll the window to a different area of the file list.
o Up to seven desktop windows can be open at once, and you can open directory windows with simple key presses -- even change a window to show a different drive without closing and reopening it.
o The "View" menu now has an "unsorted" option, for showing the actual order of files and folders in a directory.
o Any character in the "upper half" of the ST's font can be typed in by holding the Alternate key and typing its ASCII number on the numeric keypad.
o Many of the special functions of the desktop (like copying, renaming, etc.) can now operate in "batch mode", to let you quickly rename or show info for a group of selected files, for example.
o The bootup sequence now includes a graphic display of the Atari Fuji logo, and a memory test, and a configurable bootup delay that allows hard drives time to power up. It's also possible to bypass the AUTO folder entirely by holding Control during bootup.
o Internal changes in the TOS program code result in very noticeable performance improvements in many areas.
o ...and of course, lots more. This list barely shows the tip of the iceberg, in fact.

The card is 2.5 by 2.5 inches and would require some soldering of jumpers and such to be installed in your 520 because the new TOS is located at a different address. They also have a nosolder version for Megas and one for ST's with a socketed 68000.
The TEC with TOS 2.06 and a disk of utilities costs $139 direct from CodeHead. I think the no solder version is $155. I think they just started shipping it two days ago. And I don't doubt that they will sell every single one they can get their hands on. Apparently, they've already taken advance orders well above the total number of any single piece of software they've sold so far. CodeHead can be reached at (213) 386-5735.

Supposedly one could install a switch between TOS 1.4 and TOS 2.06
for compatibility with programs that won't run under the new TOS. You
would also likely find some of your old software wouldn't work under
TOS 1.4 but not much. Most if not all new software runs under, or
sometimes requires at least TOS 1.4 (and I would assume would work
with TOS 2.06 as well.)
I would recommend at least an upgrade to TOS 1.4 just so that you
are compatible with most new commercial and non-commercial software
coming out. I would guess that you will be able to find very good
deals on used TOS 1.4 chips in the next few weeks.
You might try a ram upgrade while you are at it or even a processor
accelerator if you have the money. I started with an original 520 ST
with TOS on disk! It works great with 2.5 meg and TOS 1.4 now (and
maybe TOS 2.06 soon :). I would guess that 4meg TOS 1.4 520 STs are
not too uncommon. If you go for the ram upgrade, get one that uses
simms. (seems the way to go)

On another note, is the TOS 1.4 and 2.06 feature list in the monthly
FAQL? If not it probably should be.

(sorry this post is so long)

> So does anyone out there know where the source can be had, if at all?

I don't know what Ian's plans are with regard to releasing the source, but
1.33i definitely will work with any other 1.x version of the loader. The
object module format is identical. Just swap your modified 1.2 loader for
the one that's in the distribution.

You probably can combine the 1.33i make, cc, hcc and top with the other
binaries from Sozobon 2.0. It won't run as fast, but it'll give you long
external identifiers (SozobonX library format). Ian's version of hcc and
top will pass long identifiers unmolested; the programs that create or
manipulate .o files are the bottleneck. (I have not actually tested this,
but I see no reason why it wouldn't work.)

Could you post the change you made to the 1.2 linker?

With respect to the change in the linker, I'll have to defer to Dave Bagget
on this one, he did it.... so Dave if you read this perhaps it would be
generally useful to post the fix?

And thanks for the info, never though (for some unknown reason) to
just use the 2.0 linker. Will give it a shot tonight!

278. Power Supplies

Newsgroup: comp.sys.atari.st
Date: 1992-01-13 05:54:56 UTC
From: n160ao@tamuts.tamu.edu
Message-ID: <7555@tamsun.tamu.edu>
Source record: 227076

Lately my power supply won't give the floppy drive enough power to operate the motor that spins the floopy disk. I borrowed a power supply from a friend and decided to buy another one.

Since no local computer dealer has any desire to get one of these for me, I must mail order one. My request is for suggestions of where to buy a new power supply.

NOTE: I showed the power supply to a computer technition who has an Atari ST and he told me what parts of the power supply to repair, but I don't have the equipment or knowledge to do it. He also told me to get a power supply that exceeds Atari's standards. He said Atari only gave the power supply a 12% lee-way in the tolerance, and that adding extra memory could burn the power supply up.

With that note in mind, does any one know where to get a good power supply? Thanks.

279. Sozobon C

280. Atarians in Japan

Newsgroup: comp.sys.atari.st
Date: 1992-01-13 06:05:38 UTC
From: ytsuji@cfi.waseda.ac.jp
Message-ID: <2079@wsdnws.waseda.ac.jp>
Source record: 227078

Thanks for you all. I have managed to get rid of all the Atari stuff now.
But as I have promised to look after both the hardware and software for
six months, I have been in close contact with the Japanese Atarians here.
I think their total population is some 200 in Japan or maybe more and the
number of people who subscribe to a major AtariST SIG on a commercial
BBS (Nikkei MIX) is about 50. Atari things all go through one wholesaler
called Cameo International which is a music instrument dealer, which is the
reason that you only find Ataris in music shops in Japan.
People can now read Japanese characters on their ST's but cannot input
them without the help of GCR Spectre with Mac's Japanese language software.
Commonest Japanese characters are coded as 16 bytes per character, which
is 8x16 dots and the total number is usually 5000, not 256.
The cheapest AtariST cannot beat that of a Mac Classic, neither can
Amiga. Therefore I don't think there will be a chance for Atari or Amiga
to prevail in Japan. Mac now has has become well established here and is
probably the second best sold personal computer here. Amiga is doing well
for unknown reasons. Maybe be they have the better CRT than Ataris for
playing games.
I just cannot understand why people buy expensive MacII's instead of
Sun's ELC or IPX: maybe they have some nice software in mind.

Best wishes to you all.
Tsuji

Ah, I forgot to write the most important thing. There are a quite a few software for workstations that take care of inputting Japanese language, but they all run after 'server -- client' fashion. If someone has ever managed to compile the server (i.e. key input and CRT display side) software of X11 on AtariST, let me know. Any idea of turning AtariST into an X server?
Tsuji

This is a known problem. It seems that Uniterm and WordUp are messing
around with memory and allocating all free memory in the system. The
Control Panel tries to load and execute the CPX you wanted but then
there's not enough memory in the system to do this. So nothing happens.
It would be nice if the control panel would then show up an alert box
with a simple error message.

>causes this, and how can I correct it if possible? Do I need to make
>the CPX's memory-resident?

Yes, that's the solution for your problem. If you make the CPX's memory-
resident then they will be loaded at boot-time and stay resident in your
memory (and, in fact, will use a lot of it).

After some experimentation, I'll pull back slightly from that statement.
The original Sozobon ld.ttp and the one in the Sozobon 2.0 distribution
aren't smart enough to come in out of the rain. You MUST give them
complete, accurate filenames. The Heat and Serve cc.ttp compiler driver
doesn't do that. The results vary from simple failure to bombs.

I fixed the 2.0 ld sources as shown below, and right now I have the Heat
and Serve (1.33i) compiler and optimizer running in conjunction with the
Sozobon 2.0 assembler and loader. It seems to be working; at least I've
used it to recompile ld.ttp a couple of times. Long external identifiers
seem to work, too.

In the main.c file from the ld sources, I changed one declaration:

char *oname = "a.out"; /* sdy: fixed uninitialized pointer */

I couldn't find any place in the ld sources where oname would be set
to anything meaningful in the event that you failed to pass a filename
with the -o switch. (How long has this bug existed?)

The right way to fix it would be to write code to strip the first filename
other than the startup module and use it as a root for the output file,
but I haven't gotten around to that. I can't find any code in the sources
that would implement the behavior documented in sozobon.doc.

In the pass1.c file, I added the following code to pass1():

pass1(s)
char *s;
{
struct finfo *fp;
int fd;

#ifndef UNIXHOST /* sdy added */
char *p, *q;
char *pfindfile();
long fsize();
char *getenv(), *strrchr();
if (fsize(s) == -1L) /* file not found as specified */
```

```
{
q = strrchr(s,'.');
p = pfindfile(getenv("LIB"),s,q ? q : "\0");
if (!p)
{
fatals("pfindfile can\'t locate: ",s);
}
s = p;
}
#endif

fp = (struct finfo *)mmalloc(strlen(s) + sizeof(struct finfo));
... et cetera.
```

This code simply uses the dLibs pfindfile function to search for a file in the LIB directory if it isn't found as specified. A minor bug in this implementation is that if LIB isn't in the environment, pfindfile will try PATH. Or maybe that's a feature.

Well, I had a few problems with the Cheetah program, but I think that they
were bugs related to NeoDesk. The problem occured after returning to NeoDesk.
If you really want to avoid problems, reset the machine when you are done with
Cheetah.

286. New mono monitors & PixelWonder

Newsgroup: comp.sys.atari.st
Date: 1992-01-13 09:42:15 UTC
From: jonal@sofus.dhhalden.no
Message-ID: <jonal.15@sofus.dhhalden.no>
Source record: 227085

What's up with all these new mono monitors appearing from Atari?

We recently got (well, here in Europe anyway) the 14" SM144, a flatscreen monitor with MegaSTE compatible tilt/swivel base. Seemingly bigger dot pitch than my SM124 and with _ONE_ speaker. ZNet 92-02 reported about a SM147, another 14" screen. It is apparently the same as the SM144, but without the speaker.

Has anyone tried these new monitors with the PixelWonder card (a OverScan like solder-in thing that gives 758x528 on a SM124)? Which resolutions can you get on thiese screens?

I can't afford a 19" at the moment, but as the PixelWonder card is about $100,- it would give me a little peace of mind for a while.

The new monitors are better looking and fits better on a Mega STE and I would get a new one if the card works well with them.

Any comments? Please post or mail! Thanks!

I'm only working with some third-hand information here so I apologise for the lack of detail, but has anyone heard of an ST virus that greets you with some phrase like "the little green selector"? For all I know this may not be a virus at all - it could be part of an application that is running - but I thought that it might ring bells with someone here if it was. And, if it IS a virus, does anyone know what virus-hunting tools are around that would help to get rid of it?

I'm using the harddrive at the momentr with the OMTI 5520 with an adapter who
can be only as a singel applikation at the DMA-port. ANd I want to use the
OMTI 5400 because the OMTI 5400 is connected to my SCSI hostadapter, and so
i can use my SCSI drive too.

I've seen quite a few posts about this; I'm probably going to get one as soon as they are released, but I'm interested in hearing about the 4 meg ST RAM it's supposed to have; is this really true? If I have 4 meg fastram as well (which I intend to), can '030 processes use this as well (I'm really thinking of background tasks in MiNT).

Also, how difficult is it to install in a Mega ST? (Give me a soldering iron and I can kiss my ST goodbye).

Also (wot? more?) does virtual memory work the same on any 68030 (ie. if I were to try (note "try") to add VM to MiNT, would it work on a TT too?)?

> that it has energy/mana to do so. No human player could do that.

I might be that the computer has some major advantages as he is able to
overview the whole map at once. I suggest that, if the setting says tha
that water is harfull, any landmass that you as human build, should be
least 2 layers high. This way, when the computer call flood, you don't
suffer any harm, but afterwards the land is at level one again. If the
comp seems capable of getting another flood, you should raise the whole land
again.

(BTW I never got past ca. 130 even with this trick)

From: rlw@ukc.ac.uk
Message-ID: <232@eagle.ukc.ac.uk>
Source record: 227089

I need a little help with Dungeon Master. I am on level 6 and I have collected all of the iron keys from all of the rooms (including the one you get for getting the riddles right) and yet I still dont have enough. There is one door which is locked requiring an iron key. I can get down to the next level, but from the maps I see that this door has a valuable behind it.

Where is the other iron key to be found? is it deeper in the dungeon or have I just missed it on level 6 (or an even earlier level).

I appreciate your help on this one

Cheers - Dick

>program, so use it with *EXTREME* caution.

The oddest thing about Atari computers seems to be their differences from each other. I used Cheetah extensively for about two years (a quess), with tos 1.2, tos 1.4 accelerator boards, hard drive caches, and a HUGE variety of auto programs and desk accs. I have quite literally never had a single problem with it in any way. I'm also using it out of Neodesk, and I've never had the problem with "empty folders" that was reported here... Why do computers that are supposedly "identical" (or damn near) act in such different ways for different people... aaaaarrrrrgggggghhhhhhhhh!!!!!!!!

At any rate, Cheetah works great for some of us...

By the way, you really should read my cool .sig file ;-)

>memory (and, in fact, will use a lot of it).

For Uniterm, there is another solution. Uniterm winds up setting up
buffers for various & sundry purposes. (Clipboard, data transfer,
RS232 buffering, AND) Notably: System and History buffers. The
default System buffer is either 32 or 64K, and then "The Rest of
memory" goes to the History buffer. In other words, IF I turn history
on, and leave the defaults in place, I can go back and look at the
last 900K of history information! Since a typical session
doesn't involve that much data, and I'd like sometimes to run external
programs/CPXes, I've changed the System buffer size to something a
little more sensible (875K, on my 2MB system).

In other words, if you increase the size of the System buffer to
something big enough (128K? 200K?), you'll be able to load in those
CPXes, WITHOUT the cost of PERMANENTLY having memory occupied by them.

> guide me through the installation, and a compile of the "Hello World"
> program.

You won't find a step-by-step installation guide in the Sozobon
1.2 package, and the 2.0 package is just an upgrade of the
1.2 binaries.

I suggest that you set aside everything you downloaded from the
languages directory and get the ``Heat and Serve'' Sozobon C
1.33i, which moved last week in comp.binaries.atari.st.

All you need to do with 1.33i is un-ZOO the file, double-click
INSTALL.PRG, tell it where you want to put the components, and
sit back while INSTALL does all the work. You'll be compiling
hello.c (and GEM sources, too) in a matter of minutes, because
the example code and makefiles are part of the package.

If you don't have access to that newsgroup at your site or if
those files already have expired on your news system,
atari.archive keeps the original uuencoded postings in a
separate (unindexed) directory. You also can get it by email
from archive-server@twitterpater.eng.sun.com.

>

These are archive files (somewhat like .arc or .lzh). The difference is that they contain an entire disk (including format info and boot sector). The program is called Magic Shadow Archiver (msa) and is available from atari.archive. Since the compression algorithm built into MSA is a bit slow and inefficient, often these files are then arced or lzhed.

}Hmmm... But some copy-programms copy a normaly Amiga-Formated disk without
}problems. So, why should it not be possible to do it??
}
}Perhaps you are right when you look at single sectors, but i think if i can
}read track by track, that would be enough to build up a AmigaFS
}
}Phil. (zxmgn01@mailserv.zdv.uni-tuebingen.de)

You can copy a Spectre formatted (I'm not sure about a straight Mac disk) disk the same way... The only caveat is that you should override any checks the program does to find out the disk format. As far as I know, Mac (and Spectre) disks are _always_ 2 sides, 10 sectors, and 80 tracks.

So, it _might_ be possible to write a MFS filesystem reader/writer for the new MiNT loadable filesystems... It _should_ be possible to do an AmigaFS filesystem... I have a feeling Mac HFS would be either impossible or incredibly difficult, since Dave Small couldn't do it...

{ Material deleted }

I just did this Sunday. I would suggest care if you have a dual disk situation (I've got 2 DS/DD drives w/ no hard drive [just cannot find the bucks, especially when my favorite sequencing program, Tiger Cub, is still copy-protected [boo-hiss]]). The un-ZOOed output will almost fill a DS/DD diskette. Therefore, you may need to extract files individually and copy them to a source diskette for performing an install.

Otherwise, Sozobon 1.33i went in smooth as silk for me (accept for a problem with my TMP variable and taking advantage of multiple path searches for LIB and INCLUDE in 1.33i which lets me separate my stuff from the Sozobon stuff).

Have fun! - Bob

Here the latest information I got from Gadgets (dated December 31): Spectre 3.1 *should* be ready at the end of January - and it will support System 7. However, since then I wasn`t able to reach anybody at Gadgets`. I understand that the lady who ran the paperworks quit in December and moved to Jamaica.

Since then, Gadgets has been, hmm - let`s say less than responsive.

Anyway, all release dates by Gadgets should be taken with a grain of salt, considering that the original release date for Spectre 3.1 was in Summer 1991...

>
> Alan Hourihane
>
> email: alanh@logitek.co.uk

Nope.

The Mega STE has a 68000 CPU in a PLCC socket - while the 68030 SST is
designed to replace a 68000 CPU in DIL style. Also, the form factor in
the Mega STE is very different from the Mega ST - so the SST would simply
not fit into the case.

A SST for the Mega STE may come out, according to Dave Small. But then
again, this is "may" as in "may be, may be not"...

317. What failure modes on 520st and mono monitors?

Newsgroup: comp.sys.atari.st
Date: 1992-01-13 23:01:33 UTC
From: paul@suite.sw.oz.au
Message-ID: <paul.695343693@suite.sw.oz.au>
Source record: 226913

Hello people,
I've just inherited two 520st's and their monochrome monitors.
It appears that the power supply in one of the st's has died, one monitor
is dead, and the other appears to be on the way out.

Does anyone in netland know of the failure modes of these things? My task
of fixing them will be somewhat easier with a bit of background knowlege
about components that are likely to have failed, and what to look out for.

Any help would be appreciated.

Paul

319. Spectrum Code Fix?

Newsgroup: comp.sys.atari.st
Date: 1992-01-13 23:11:43 UTC
From: stevendd@mentor.cc.purdue.edu
Message-ID: <31022@mentor.cc.purdue.edu>
Source record: 226909
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

A while ago the source code to display a Spectrum picture was posted. This code worked great until it exited, and then it locked up. Does anyone have the code to allow this program to exit correctly?

Its possible that I may be at fault, since my compiler doesn't have an "illegal" macro. Which might make the program end properly.

If you know how to modify the formentioned program to make it exit correctly, or if you have another version all together let me know.

Thanks a lot, Doug.

321. STe's

Newsgroup: comp.sys.atari.st
Date: 1992-01-13 23:49:12 UTC
From: Azog-Thoth@cup.portal.com
Message-ID: <52748@cup.portal.com>
Source record: 226914

This message is mostly irrelevant babbling, so if you dont want to read about my experiences with my non-Mega STe, quit out now...

I like to post things like this, just in case anyone is interested, but never saw the info before...

I recently (tuesday the 7) received my new 520STe that I ordered from a mail order company (D&P Computers, for $339. Sorry if that sounds commercial, I am in now way affiliated with this company, but they seem to be the best price around). On Friday the 10, I got 4 1mb SIMMs modules and upgraded it, and now, its like a whole new machine.

So far, what Ive done is make a 1mb RAM disk, copy NeoDesk3 to it, and run NeoDesk from the RAM disk. Can you say speed? I also am running Uniterm from the RAM disk. Accessory wise, I have the slots all filled up: RAM disk, EyeCon (what the heck), NeoControl Panel, NeoTrashcan, and NeoPrint Queue. All this is running at the same time, I didnt need to unload NeoDesk to run Uniterm (with the old 512k, I did). This is great! Too bad 4mb is all this thing can support (or as far as I know, thats all)

My next addition will probably be a hard drive. I have a ST-225 20mb drive doing nothing, and was considering the AdSCSI Plus ST adapter. That has a clock, and what I imagine is that it lets you use ST-506 type drives on the ST.

Either that, or I hear that TOS 2.06 is now available for the STes. Anyone have it yet? How much?

Then all I need is a colour monitor :-) (thinking about the Atari stereo one, but thats like $350).

Who says Amiga is the best? :-) (please lets not start on that again, just my humble opinion)

Billy D'Augustine
Azog-Thoth@cup.portal.com

322. Monitor question

This reminds me, did Atari recently update their keyboards? I have a 1040STe
that I purchased around two months ago, and I like the keyboard. It is quite
a bit better than the one on my friend's 1040STe of 18 months ago... It has
little mush, and the keys have just about the right amount of spring to them.

(Of course, Atari hasn't always been known for their consistency in product
:-))

Later,
Steven Ourada

In a previous article, Azog-Thoth@cup.portal.com (William Thomas Daugustine) says:

>Then all I need is a colour monitor :-) (thinking about the
>Atari stereo one, but thats like $350).

I've got an SC1435. (The 14" stereo color monitor) I think it is worth the money for what you get. Although the larger screen does take some getting used to, it has volume, contrast, brightness and horizontal controls on the front panel, and even has a green mode. The tilt/swivel stand it comes with is rather nice, too.

One major difference is that all of those programs that would print things way off in the margins of the screen where I couldn't see them are now not nearly as annoying. Heck, not annoying at all, even.

(And then there's when I have the ST hooked up to my 27" TV and my rather modest stereo... Nah, I won't get into that.)

A few people don't seem to know this, but the Amiga is a 11 sector format
with NO CRC checking, it uses Sum Checks, also they don't use the
index mark, all this causes problems with a real disk controler..

Also all sector writes are a full track write as they don't use Gaps..!!

The "Little Green File Selector" is an alternative file selector
written by Charles F. Johnson of CodeHead Software.

His Shareware company is called "Little Green Footballs"
(don't ask me.. ask him...! :)

I don't use that file selector, so I don't know what messages it
might print while installing, or while being used, but unless
someone has mucked around with it, it's a legitimate and very
useful program.

I know Charles monitors this newsgroup, but just in case he
doesn't see this thread right away, I'll let him know about
these concerns, and let him address the issue...

Hi,

Some time ago I bought the game `Airball' and while it
was fairly addictive I stopped playing it. The reason is
that I couldn't find the `flask.' Is there anyone out there
that knows where I can find it?

Richard

Well I know this is true but when you use a word as an offset in such a way it
is treated as a signed number. So the first 32768 offsets are above the base
value and the next 32768 are below. Maybe Megamax did use 64K segments. It
would have been a little more tricky I guess but definately not impossible.

336. CS-TEX (24pin fonts) || AFXpack

Newsgroup: comp.sys.atari.st
Date: 1992-01-14 08:48:06 UTC
From: dah90@ecs.soton.ac.uk
Message-ID: <10218@ecs.soton.ac.uk>
Source record: 226942

Okay, I've just downloaded and installed 24pin1.lzh and 24pin2.lzh from a.a. I managed to get the install program to work even though the docs are in german (I don't know any).

The fonts are now in the prtfonts directory in my tex folder. And the driver (nb24new) is there as well. But when I try to use nb24new to print a dvi file I get an error message. Armed with a german-to-english dictionary I _roughly_ translated. It said the driver had failed and asked me to Noder or Abbruch - (something or abort I think).

Noder does nothing. Abbruch then brings a message which I can only translate as saying it can't find a font list. Since the installation program produced no font list, what can I do?

Has anyone else had this problem??

On a completely different tack, I downloaded lzh201i yesterday. I is all in german, again. What I really want to know is: is AFXPACK in the public domain? If it is (there is a file called AFX_D in the archive), then in there an english version of lzh201i floating around?

I would be very grateful if someeone would answer one/both of these. Thanks.

This is from a company that made the cartridge port read only.
That put the ST joystick ports in such an inaccessable place that most D
shells won't fit (and did the same with the extra STE ports). That uses
non-standard DIN and DB connectors on its floppy, video and hard disk ports.

Nothing personal Tracey (sp?) but it's been building up.

Message-ID: <1992Jan14.085741.15540@ux1.cso.uiuc.edu>
Source record: 226929

Does Spectre GCR work with the overscan modification??????

And on the TT, does it run in the color modes, i.e. TT med res.

I know it won't be in color, I am just wondering whether it can
run a mono 640x480 mode.

Does Spectre GCR do the sound via DMA sound on an STe, or is it done
in software, like on the regular ST?

Any help is appreciated (of course)!

Dear Bill

Have you ever heared of something like "REFRESHING D-RAM's". This is the thing
the old ST-MMU does and what the TT-MCU is needed for. On the memory-expansions
sold by ATARI, RICHTER and others (here in Germany) there is only the MCU beside
some SIMM sockets.
So why do you blame ATARI if you havent seen an expansion ...

Greetings Ewald

Hello out there,
I want to run programs for the IBM PC machines on my ST and as far as
I know there are two ways of doing this.
1) Use some emulation software such as PC Ditto.
2) Buy a chip which does the emulation.
I have heard the second option can be bought, but what I want to know is,
How good is it? How easy is it to install? Where can I get it and how
much does it cost? How fast do they run the programs?
If anyone out there has, or has seen such emulators, please let me know what
they are like.

Message-ID: <9440002@hpcpbla.bri.hp.com>
Source record: 226940

Many thanks to all those who responded to my Green Selector "virus"
query. I realise now that this thing is in fact a file selector
replacement for the ST that is supposed to be superior to the standard
one, so is in fact a properly installed piece of software. I only heard
about the original problem third-hand from a fairly computer non-literate
person; I've not seen it myself (in fact, I've never even touched an ST),
hence the poor quality info and confusion.

346. Grad School Plea: Please read this

Newsgroup: comp.sys.atari.st
Date: 1992-01-14 12:25:47 UTC
From: weiner@TERMINATOR.CC.UMICH.EDU
Message-ID: <9201141225.AA21732@terminator.cc.umich.edu>
Source record: 226938

As some of you may know, I'll be graduating this May. When I was filling out grad school applications, the idea for a recommendation from the usenet atari community as a whole crossed my mind as something that would be pretty interesting (especially considering how much time I spend with doing archive related stuff :)).

With this in mind, please consider writing a brief note, saying what you think my chances for to complete a graduate degree in statistics are. I realize this is quite difficult, but there are some aspects of my work that some of you have certainly had contact with, such as my organizational skills, my writing ability (Remember the ftp guide, etc.), my teaching ability (ever try to help someone set up gnu c over email, a question at a time?), and so on.

Here's how we've set this up to work:

1. You decide you'd like to help me out. You then send a brief not to Fred Swartz, the archive administrator, who has agreed to accept letters. His address is archive-admin@archive.umich.edu.

2. Fred will collect them, print them out, and enclose them in the sealed envelope. I will NOT see these, unless you specifically state that you'd like me to in your letter.

3. Fred will vouch for the authenticity of the e-mail, and sign all the forms.

That's really about it. Hopefully, admissions committees will look at this as something original and then with this and everything else admit me to their graduate program in statistics.

For the record, I'm currently interested in U of Washington, U of Minnesota, U of North Carolina-Chapel Hill, and Carnegie-Mellon. There is a number of other schools that I am considering applying to also, but for now these four are it.

I'd like to thank all of you who reply, it really means a lot to me.

Don't connect the mono detect to any voltage, it is connected to 0 volts
if mono, it has its own pull up resistor..

Also a colour TV is not that good, inless it has a Scart RGB input,
so be warned...

> there something else I can do?

I think the problem arises whenver you read keyboard input by file (=handle).
To get the keys that do not return any ascii value you have to get hold
of the scancode (as returned by Conin() Gemdos 1), which marks the key that
was pressed without any interpretation. Additionally you have to find out
whether any shift/ctrl/alt key is pressed at the same time. This can be done
by a Gemdos (or Bios) call too, or if some bit in 0x484.b is set, the status
is returned with Conin aswell (I think it was bit 3).

I don't use MiNT, but I think there should be some special functions to use
these extended keys with the multitasking environment.

The Little Green File Selector (shareware from Charles Johnson) is the probable culprit in presenting this message. I would assume that you see this message at boot time. Take a look in the AUTO folder for a program with a name like FSELECT.PRG.

LGFS is an alternative to the GEM File Selector, and current versions have hooks in them which allow use with CodeHead products such as HotWire and MaxiDesk.

Many AUTO programs flash a message to the screen when they load at boot time, so I doubt you've got a 'virus' at all.

If you suspect you have a 'virus' because of odd behavior on the part of your computer system, may I suggest you get a copy of George Woodside's excellent program VKILLER.PRG? You should be able to obtain a copy from your local user group or the atari.archive server.

Source record: 226944

I just gave my wife my old 520 so I need something new. What about the TT? Is it fast (or slow like the Amiga 030)? Where is the best place to get one? Where do you find hardware details (like the Abacus books for the 520)? Should I take a current model or wait for the 1.44MB floppy version? How much better than a multi-synch is the Atari color monitor? Or should I get a Mega STE and a Small 030 board?

It looks a little bleak at the moment since I only have $2500, but I have to get *something* again.

>german-to-english dictionary I _roughly_ translated. It said the
>driver had failed and asked me to Noder or Abbruch - (something or
>abort I think).

I had this problem also. I finally had to use lzh to un-archive the
utilities. Next I had to rename the directories. I renamed ...1.000
to FONT0360, and ...1.200 to FON0432 (360 x 1.2) and so on. Then I
placed these directories in the P6_HDFNT directory. TeX could use them
then.

I don't suggest that you battle the German installation program, and just
give in to this more complicated but less frustrating way to un-archive
the fonts.

358. Drive Questions

Newsgroup: comp.sys.atari.st
Date: 1992-01-14 21:31:12 UTC
From: vicb@clark.edu
Message-ID: <1992Jan14.213112.4760@clark.edu>
Source record: 226703

OK, could I please get a couple of questions answered?

I have an old 520st, no upgrades- 512K, TOS 1.0, SS drive. I recently downloaded info on hooking a generic 720K floppy up, but is it possible to hook up a 1.44? If not, why?

Also, my brother has a 40 meg IDE hard drive he is willing to part with. Can this be plugged in like any other SCSI hard drive? I know very little about hard disk units, just that you need a host adapter and controller (which my brother tells me is built in to an IDE) as well as the power supply and clock. I have been given the impression that IDE's are a little different in the storage scheme... Can this be used on my machine? He uses these on his 286.

Anyone out there willing to help? If I am in error on my assumptions please correct me. Thanks,

Victor Bruhn

359. Taps for more Ataris

Newsgroup: comp.sys.atari.st
Date: 1992-01-14 23:46:21 UTC
From: mg20+@andrew.cmu.edu
Message-ID: <kdQrNBK00VAuA4N1pr@andrew.cmu.edu>
Source record: 226707

I do hate to sound a sour note on this very vibrantly alive bboard, but over Christmas break I observed further evidence of the decaying state of Atari support by retailers.

J&R Computer World, one of the largest computer retail stores in the USA, located in downtown New York City, has all but given up the ghost on Atari systems. After continuing to sell Atari products for several years after they became unfashionable, they have apparently decided to let their Atari support quietly die. When I went there on January 4, all they had left on display was one solitary 1040STe and four pieces of Atari software wedged into the edge of the Amiga section. They used to have three whole shelves of Atari software, which had dwindled to one shelf by the summer of '91, and now has disappeared. They have also stopped advertising Atari software in their catalogues, although they continue to advertise 1040STe's and hard disks. They're probably just trying to get rid of their stock; the four pieces of software they have left look like they've been sitting there since 1987 or so...

BTW, J&R has added a *huge* new Macintosh section. They used to sell just PCs, Amigas, and Ataris...

Sigh.

you can do it two ways.. Get an interface to do it from CT (is what I did)
from Germany or get say a mega keyboard from beST electronic's and use that.

368. Problems with Word Up 3.0 and Mega STe

Newsgroup: comp.sys.atari.st
Date: 1992-01-15 07:29:34 UTC
From: mmiller@isis.cs.du.edu
Message-ID: <1992Jan15.072934.8736@mnemosyne.cs.du.edu>
Source record: 226713
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

From what I've experienced with Word Up, I think it is an excellent concept. I got it with my system and I would really like to keep it, but there are some problems which make me very wary of it, and I am considering switching to another word/document processor, possibly of lesser features, if the problems cannot be remedied.

The problems I am encountering are:

- When there is no document open, and I want to open a document, it HAS to know that disk A is in drive A, otherwise it kind of crashes (I think it just goes into an infinite loop or something). But I am unable to do anything else. It just locks up. I can still move the mouse pointer though.

This does not happen if I have at least one document open. It will prompt me to insert disk A.

- If I just open and close single documents (not having more open than 1 at a time), things work out fine. But if I open more than one document at a time, it seems that I have to close them in the reverse order that they were opened, otherwise the next time I want to open a document, it crashes with 3 bombs (address error). I have sometimes noticed that if I have 3 documents open at one time, and if I alternate between closing and opening the 2nd and 3rd windows, I can avoid a crash...for a while, but eventually I get the 3 bombs again.

Being a programmer myself, I think I have a sense of what is going wrong here. It looks to me like Word Up is not managing memory well as far as maintaining memory for documents that exist in memory, and loading new ones. I thought that if a 1st document was opened, and then a 2nd, and if the 1st document was closed, that the 2nd document's contents would be copied to the 1st's place, starting at the 1st's starting pointer. This way one could load another 2nd document without worrying about stepping on another one "somewhere out there." I get the feeling that the problem is being caused by something in memory remaining static when it's not supposed to. I mean, when I do the above operation, the 2nd document moves down to the 1st document's place in the Windows menu. But it does not appear, just to my intuitive sense, that in memory the 2nd document has taken the place of the first. It just stays where it is.

Either that, or else the program is getting its pointers confused. I don't know exactly what "Address Error" means. Is it an address that is out of bounds? I have a Mega 1 STe, so would an address beyond 1

Meg. cause an address error?

- In text mode, at least, almost every time I edit a line (inserting or deleting) it "shaves off" the top of the line below it, and moves that top part along with the line I am editing. Sometimes it seems Word Up is able to compensate, by moving the "shaved" part back, but usually it fails.

Other than these bugs, the program has worked great. I have had no problems using multiple fonts, using the spell checker, or printing in the various modes, with, and without fonts (text mode).

I heard a while back that Atari had acquired the rights to Word Up, and would be selling it someday. Does anyone know when they will be releasing their version? I assume they have made efforts to make it more STe compatible. Will they support existing Word Up customers with upgrades? That question was unanswered the last time I heard anything about this. I have been wanting to mail my registration form, but I heard that Neocept went out of business, and Atari got the rights to it. So I don't know where to mail it.

Is there a patch available somewhere that would fix the problems I am having with it?

If nothing else, could someone recommend good word/document processors that have the following features: multiple fonts (not just those that the printer supports), headers, footers, selective page numbering (like only putting the page number on all but the first page), a spell checker (among other advanced features), and is compatible with the Mega STe (or just STe's in general). Being able to put graphics in documents is nice, but for me it is just iceing on the cake. It's not really necessary. Please give company name, and price, along with the software title.

Thank you,

Well the colour ones are the same brand as the Amiga ones, also known
as a Philips CM8833 and lots of other Badge names, they work, but as not as
sharp as the older Atari ones, as the Dot Pitch is only 0.42mm,
the older monitors were 0.38 or 0.39 mm.

But these new ones do have connections for a VCR, even Super VHS,
they did have separate Chroma/Luminance inputs..

I'm unable to help you about installing programs such as you describe from pascal or C, but the way it's done from assembly language is to modify interupt vectors in low ram.
There is no reason to write another bomb-out error handler as one already exists in the PD. I think it was published on the STFORMAT cover disk, but sohuld be available at atari.archive, and is called NOBOMB.PRG.
I'll post example code of how to install interupt vectors from assembly language if you're still interested.

Message-ID: <1992Jan15.125930.22408@syscon.rn.com>
Source record: 226718

The floppy controller in the ST is not designed to operate at the clk rate necessary for 1.44M Some have boosted the clock rate with success. There is also a mod kit for using 1.44 drives availble involving a pc board installation.

IDE is different from SCSI and will not work. You can buy a standard drive, a SCSI controller and a host adapter or a SCSCI drive and host adapter. You can probably find some deals on 50Meg and smaller SCSI since the PC people are moving to larger drives pretty much.

374. How do I turn the key-sound off?

>floppy version? How much better than a multi-synch is the Atari color
>monitor? Or should I get a Mega STE and a Small 030 board?

Firstly.. what do you mean by slow/fast?

The TT (when a program is running in fast RAM) gives about half the performance of a Sun SPARCstation 1, when processor bound. If the program does a large amount of work using the built in 68882 maths co-processor then the performance drops to about 1/4 of that of a SPARCstation 1 doing the same task.

I can't tell you where to get one.. you could try phoning Atari US to see if there are any dealers.

To get any docs on the TT you either have to live in Germany and speak german, or buy the docs from Atari (as I have just done). The problem with the second source is that firstly it'll cost you about $200 and secondly you can't if Atari US doesn't support docs only support unless you become a developer!

The Atari "Multi-sync" monitor is expensive (at least here in the UK, about 450 pounds = about $850US). The only thing it has going for it is that it "knows" about the TT resolutions and so gets the aspect ratio correct for them (unless you switch it to VGA mode using the switch at the back :-)).

What machine should you get?.. Well.. what do you want to do with it?
If you want to use it for large amounts of number crunching, then get the TT or a Mega ST (not STE) with the Gadgets SST. If you just want to use GEM programs with some speed, buy the Mega STE (I don't think the SST will fit in a Mega STE).

The Mega STE is probably the more "ST compatible" as it's still got a 68000 in it rather than a 68030.

>
>It looks a little bleak at the moment since I only have $2500, but I
>have to get *something* again.
>

Why not wait for the TT040 due "sometime during the summer", it's supposed to have "broadcast graphics resolution" whatever that means! This will also

gibe you time to save for it :-)

Steve

PS. For the record... I own the following computers:-

Sinclair ZX81 + 16K RAM pack
Sinclair ZX Spectrum 48K
Memotech MTX500 (R.I.P. & no-one's ever heard of it!)
Acorn BBC Model B + DFS & 400K disk
Sinclair QL + Trump Card (896K RAM + 2x 720K floppies)
520STM + 2.5Meg RAM + 2x 720K floppies + 84MB SCSI HD (ICD adapter)
TT030 8Meg RAM + 40MB HD + Atari Colour monitor

The only Intel processor in the above machines (which I know of) it the
keyboard/serial port controller in the Sinclair QL.

Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I recently aquired a 1040STf, without a monitor. I thought it would be simple to rig my own, but I seem to have been mistaken. I have a television and a composite video monochrome monitor. When I connect the monitor to ground and monochrome (on the 1040ST) I get nothing. CV similarly gives nothing. Is there a trick I am missing? Please help me, I look forward to using this machine.

Thank you in advance.

378. Re: Taps for more Ataris

Newsgroup: comp.sys.atari.st
Date: 1992-01-15 16:08:58 UTC
From: malay@sae.com
Message-ID: <1992Jan15.160858.757@sae.com>
Source record: 226720

In article <kdQrNBK00VAuA4N1pr@andrew.cmu.edu>, mg20+@andrew.cmu.edu (Michael Paul Greelish) writes:

|> J&R Computer World, one of the largest computer retail stores in the
|> USA, located in downtown New York City, has all but given up the ghost
|> on Atari systems. After continuing to sell Atari products for several
|> years after they became unfashionable, they have apparently decided to
|> let their Atari support quietly die. When I went there on January 4, all

No $#@$%ing wonder! They only sold the 1040STe for $50 bucks more than eveybody else. I've been getting their catalogs for years. Their prices sucked and I never once considered buying anything from them - their electronics prices tend to 10% higher than the major discount chains and their software (LaserDiscs, CDs, Tapes, etc) were being sold at list or near list. They were never in the game to begin with!

Bob Malay

PS Their pricing on MACs suck, too!

379. about the 'welcome' posts

Newsgroup: comp.sys.atari.st
Date: 1992-01-15 16:14:12 UTC
From: davidli@lapis.labmed.umn.edu
Message-ID: <1992Jan15.161412.1@lapis.labmed.umn.edu>
Source record: 226731

The next three posts comprise a new, expanded version of the 'welcome'
articles previously posted to comp.sys.atari.st. Please note:

1. They are incomplete - especially the hardware section. The hardware
section contains vast areas 'under construction'. I didn't want to
hold up the mid-month release of the 'welcome' articles. If you have
some information which should go into any of these areas, please
send it to me via e-mail. I own a Mega ST, so information which only
an STe or TT owner might want to know may or may not make its way into
the articles without your help.

2. There are three parts. Comments are greatly appreciated on what
items are appropriate for a particular part.

3. I've been sick with the flu since before Christmas, so there may have
been editing errors. Let me know, and I'll correct 'em.

4. I'm still working on 'tips on setting up often-used applications', such
as Gulam, Sozobon C, MINT, etc. Send me your 'how I did X' articles.

--

David Paschall-Zimbel davidli@simvax.labmed.umn.edu

"The most important fact about Spaceship Earth: An instruction book didn't come
with it." -- R. Buckminster Fuller

DEV How do I become a developer for the Atari ST?
ERR What does TOS ERROR nn mean? What do the bombs on my screen mean?
FREE What is Free-Net and how can I get access?
MAGS What ST-oriented magazines are available for the Atari ST?
POWR Mailing list for serious Atari-users.
TIPS TIPS AND HINTS from other users
ZNET Where can I get copies of ZNET?

Welcome to comp.sys.atari.st
============================

This newsgroup is devoted to discussion about 16 and 32 bit Atari micros. At
present that includes the Atari 520ST, 1040ST, Mega ST, STe, STacy, Mega STe,
and the Atari TT. There are also emulators for the Apple Macintosh and IBM
PC/XT/AT available.

Most of the people who read this newsgroup are technically oriented.
The newsgroup serves as a resource for Atari users ... feel free to
contribute to the discussions.

Associated newsgroups include:

comp.binaries.atari.st ! uuencoded binary programs
comp.sys.atari.st.tech ! technical programming/hardware topics
comp.sources.atari.st ! uuencoded/shar sources

What sort of articles would interest people reading comp.sys.atari.st?
======================================================================

The most interesting articles are technical articles, impressions of
software/hardware, information on Atari user-groups and shows, or helpful
hints on how to make better use of the machine and its software.

The least interesting articles are in the form of 'my computer is better
than...', especially when cross-posted outside of comp.sys.atari.st. If
```

you don't know how to eliminate other newsgroups from a reply to an article which is cross-posted, ask your systems administrator.

'FOR-SALE' articles should be posted to misc.forsale, and ONLY local distribution of comp.sys.atari.st. Those outside the United States have little desire to read about that neat bit of [hard/soft]ware you're selling when you live in the U.S.A. If you don't know how to restrict distribution of a posting, ask your systems administrator.

There are two other postings which complete the 'welcome' information. In Part 2, general questions regarding software, including FTP and e-mail sites of Public Domain/Shareware software, are discussed. In Part 3, general questions regarding hardware are discussed.

POWR
Mailing list for serious Atari-users
==========

Jari Lehto announced a mailing list for serious Atari users in October of 1991. The following information appeared in his posting:

It is quite parallel to comp.sys.atari.st, but more expert-oriented and only for certain group of people; developers, hardware-wizards, hobby-importers, moderators, user-clubs etc. = really serious users.

The address of the list is: ataripu@otax.hut.fi

Requests and stuff concerning the list: jartsu@otax.hut.fi

[use this address to subscribe, send a brief note about yourself and what you hope to get out of the list, DPZ]:

Things concerning Atari, not especially the list: jartsu@nic.funet.fi
(I am one of the Atari pd-area moderators at nic)

The list has been up for several months now, and it has about 50 members now, majority is TT-users.

Especially I would like to have more German members to the list, since their own group in news dnet.atari is not so widely distributed.

FREE
What is Free-Net and how can I get access?
==========

A "Remodeled" Atari S.I.G. Opens

By now many of you have heard of the Cleveland Freenet, or more specifically the Atari S.I.G. on the Cleveland Freenet. For those who haven't, the Cleveland Freenet is an experimental computer system providing free public community telecomputing. Basically, it's a lot like a public library of the future. Many of these systems are popping up all over the country. Don't be surprised if one pops up in your neighborhood in the future.

Recently the Atari SIG has undergone a significant face-lift. All the regular areas are intact including its news sections, user group newsletter, online magazine sections, general as well as specific computer discussion boards (8 bit, 16/32 bit, Lynx, Portfolio), and our weekly Sunday night multi-chat conference.

The conference starts at 8pm EST sharp and is on channel "+Ataricon". What the staff at the Atari SIG has added, has given the Atari SIG the potential to cover all grounds of Atari and its related products.

The most noticeable addition to the Atari SIG is the Programming and Development Forum. This forum is intended to be used by developers, professional programmers, and Atari hackers (the old definition of "hacker") as a means to share ideas, help each other out, and find out the latest technical information on Atari's products. This board is ran by newly acquired SIG Operator, Peter Haller, a professional programmer who is running developer sections on hardware and software development, programming, MIDI applications development, Graphics Design, plus many other sections that can definitely become a programmer and developer's dream come true!

Last, but definitely not least, the Atari SIG has a restructured Product Info and Support Board and a new Special Applications Board. The Support Board includes a vast library of support lists. These lists range anywhere from phone numbers of Atari dealers and producers, to software reviews for 8 bit, 16/32 bit, Lynx, and Portfolio software. To sum it all up this area covers what's out there, who makes it, and how to get it for all Atari products. The Special Applications Board is just starting out. Currently there is an area for users of MIDI on the ST. MIDI users are encouraged to use this as a means to discuss MIDI related topics. This section is expected to expand in the future.

Accessing the Atari SIG has never been easier. One can access it via Internet by telenet'ing to 129.22.8.75 or "Freenet-in-b.cwru.edu" or by calling (216) 368-3888 300/1200/2400 bps. Once on the system, a user can apply for an account application and logon as a visitor. Once here, simply type "Go Atari" to get to the Atari SIG. A visitor can go anywhere on the Freenet and can read anything. They can't post messages until they get their permanent accounts, however.

For additional information on obtaining access to Freenet write to myself via the e-mail addresses above or by writing the SIG at its US mail address:
The Atari SIG
P.O. Box 21815
Cleveland, OH 44121 USA

Lastly, a freenet application is available in the mail by writing a request to the above address if you rather not download it from Freenet.

The Atari SIG is ready to serve the thousands of Atarians throughout the world. We look forward to seeing you all real soon! Remember the

staff of the Atari SIG are volunteering their time for no pay and the Cleveland Freenet, as well as the Atari S.I.G., is a non-profit organization existing for the free exchange of information.

DEV
How do I become a developer for the Atari ST?
==========

Contact Gail Johnson, Atari Rep Person, (408)745-2022

[UNITED STATES ONLY. IF YOU LIVE OUTSIDE THE UNITED STATES, CONTACT YOUR COUNTRY'S ATARI HEADQUARTERS FOR MORE INFORMATION.]

Gail can explain the program to you, and send an information packet if you desire.

Atari has gone to a 2-tier developer membership. The 'higher quality' developer support goes to commercial developers, and costs $250. The 'no-hand-holding, no announcement of company future products, no access to discounted hardware' goes to noncommercial developers, at an initial cost of $125, plus $50 renewal fee each year.

Both tiers receive the ST/TT Developer Kit and all developers have to fill in an application form and a non-disclosure agreement. Contact Gail for more information.

ZNET
Where can I get copies of ZNET?
==========

ZNET on-line magazine is available on CompuServe and GEnie. You can also get copies mailed to you by sending an e-mail message to

stzmagazine-request@virginia.edu

indicating you wish to subscribe.

They won't get to you on Friday (which is when they're posted), but Greg Lindahl provides an excellent service to the networking community by sending these out.

ZNET, ST Report and some information from the Current Notes user magazine are also available from the atari.archive server under /atari/magazines.

MAGS
What magazines are available for the Atari ST?
==========

The information here is preliminary. If you've got updates, mini-reviews, or more information on other magazines, please send them to me via e-mail. As always, WRITE to a company before sending them money for a subscription.

US mags:

AtariUser, published by Quill Publishing Company

Cover Price: US $1.00 Canada $1.45 UK 1.50 (AtariUser is available for free [$8.00/50 magazine shipping charge] from participating computer dealers, bookstores & user groups!)

Subcription Rate: $21.30 US Bulkrate, $41.30 US First Class.
Address: AtariUser, 113 W. College Street, Covina, CA 91723 USA

Current Notes, published by Current Notes Inc.

Cover Price: US $3.95

Subscription Rate: $27.00/year (Atari clubs registered with Current Notes may subscribe at $23.00/year) US, $35.00/year (Canadian club members at $31/year) Canadian, Foreign rate $44/year.

Address: Current Notes Inc., 122 N. Johnson Rd., Sterling, VA 22170 USA

Atari Interface:

Write for a free sample copy of the Atari Interface magazine
(Unicorn Publications, 3487 Braeburn Circle, Ann Arbor, MI 48108)

AIM is soon to be available in Canada, Europe and Mexico, and should be in all local WaldenSoftware stores and many bookstores. If your "local" Atari dealer doesn't have it, he should be able to get it for you...

UK Mags:

ST Applications:
---

formerly the ST Club Newsletter, this is now the only non-games mag in the UK (although see ST World below). Approx. 4,500 copies per issue sold. News, reviews, interviews, tech tips, general forum, programmers' forum, PD catalogue. DTP'd on an ST. Retains a 'user-driven' feel. Recommended. The associated ST Club runs a PD distribution service and distributes a couple of commercial programs too (Fontkit Plus, UIS III, Molgraph, CRL Virus Killer, etc.).

Subscription costs: UK - 15 pounds; Europe - 18 pounds (Air Mail); worldwide - 28 pounds (Air Mail)

Address: ST Club, 49 Stoney Street, Nottingham, NG1 1LX ENGLAND

ST World:
---

formerly the leading UK non-games mag. Became a quarterly
'buyer's guide' in Autumn 90. Now, allegedly, about to be revived as a
monthly (under the stewardship of Jean Gollner, mother of ex-editor
Hugh) in the wake of Atari UK's new push into the 'serious' market.

ST Format:
---

all-purpose 150-page monthly, mainly aimed at young people.
Lively, but of uneven quality. Big leisure section, but other areas
covered too. Includes cover disk - mix of games demos and (usually out
of date) PD utilities. Probably the biggest-selling UK ST mag. Has had
several public rows with Atari UK.

Atari ST User:
---

like ST Format. Generally (amongst online users) thought
to be not quite as good.

ST Action:
---

games, games and more games. And games.

There are ST sections in New Computer Express (weekly), Computer Shopper
(monthly) and some general-purpose games mags whose names I forget.

There are also, I think, some MIDI mags with strong ST content. I don't
have their names.

German Mags:

Atari PD Journal:

Reviewed in the May '91 issue of Current Notes [from which I'm cribbing this
information, DP-Z]. Hardware and Software reviews, some commercial software
reviewed. Typical issue runs around 90 pages. Special "Katalog" section.

Subscription: DM 70 (normal mail), DM 100 (air mail). Prices may be for
domestic distribution -- write first!

Address: Heim Verlag, PD Abonnement, Heidleberger Landstrasse 194, 6100
Darmstadt 13 GERMANY

ST-Magazin (formerly 68000er):

(monthly) Typical issue: around 150 pages. Includes DTP-magazine CICERO.

Subscription: DM 77 (domestic distribution); foreign - write for information

Address: ST-Magazin, Markt & Technik Verlag AG, Hans-Pinsel-Strasse 2,
D-8013 Haar bei Muenchen GERMANY

ST Computer:
----

11 issues/year, typical around 180 pages

Subscription: DM 80 (domestic), DM 100 (normal mail), DM 130 (air mail)

Address: Heim Verlag, Heidelberger Landstr. 194, D-6100 Darmstadt 13 GERMANY

French mags:

ST MAGAZINE:

The November issue ('91?) contains technical articles about hardware and
software ("La norme XBRA", "Les interfaces serie du TT (part 2)",
"Les objets "USERDEF"", etc.), reviews ("NeoDesk v3.02", etc.) and
interviews ("Le petite monde de Dave Small", "Paris pour Les Jeunes").
The issue also contained le dossier musique describing the various
soundtracker programs available. There is also a disk available with the
magazine.

TIPS
TIPS AND HINTS from other users
==========

Any 'multisync' monitor which handles 70 video fields a second can be used with the ST; the custom cable involves no tricks, or commercial ones are available. The original NEC multisync does NOT handle 70 fields a sec.

More than 3 bombs often means more than 1 error, so interpretations are tricky.

An ST-formatted disk which is not readable by a PC can be made readable by putting the 3 bytes EB 34 90 (those were 3 bytes of hex) at the beginning of the boot sector (sector 1 of track 0, I believe). This can be done with either an ST or PC absolute sector editor.

Some (older) PC-3.5"-drives cannot deal with the short track-header produced by ST formatters. On those drives, ST-formatted disks are not readable, independent of their boot sector contents. The other way, however, does always work: format on the PC.

When using disks formatted on a PC in an ST, make sure to insert and access a disk with a different serial number in between disk changes.

For those with the 'inaccessible' mouse and joystick ports, a joystick extender cable will make life easier. The Y-cable joystick extenders make it extremely easy to keep mouse and joystick connected to port 0, and a joystick extender cable in port 1 makes for easy hookup after you've moved the machine.

BARREL is a program which can redirect printer-data to a file. It comes in handy when your printer is unavailable, and the program does not already have an option to 'print-to-a-file'. (It is available on the atari.archive server.)

DBLEFEAT is a program which can redirect disk access from, say, drive A to drive B. Handy when a program 'hard-codes' the data drive, and you wish to use your hard drive instead. (It is available on the atari.archive server.)

PD
Where can I get Public Domain/Shareware software?
================================================

There are FTP sources and a comp.sources.atari.st/comp.binaries.atari.st
mail server. You can also try the commercial on-line services such as
GEnie, CompuServe, Delphi and Bix.

Using FTP, most files should be retrieved in BINARY format (at least those
ending with the suffix of .ARC, .LZH, .ZOO, .PRG, .TTP, .TOS)

Mail servers encode files. You will need a program called 'uudecode' in
order to change files ending with the suffix .UUE (or .UAB, .UAC, etc.)
into their original form.

For Mail Service:

archive-server@twitterpater.Eng.Sun.COM:
-----------------------------------
```

Twitterpater holds all of the comp.sources.atari.st / comp.binaries.atari.st postings. If you aren't reading these two newsgroups, you should consider doing so. You may obtain uuencoded files as e-mail. You can obtain a help file by mailing a message to archive-server@twitterpater.eng.sun.com, with the main body of the message being the word 'help'.

atari@atari.archive.umich.edu:

The atari.archive server is mentioned many times in this article. It contains a multitude of Atari ST PD and shareware programs. If you don't have access via FTP you can obtain many of the files via e-mail. You should first obtain a help file by mailing a message to atari@atari.archive.umich.edu, with the main body of the message being the word 'help.'. If you are from a uucp site, please enclose this statement also 'path host1!host2!....', where host1!host2!... is your path. Please read the help file completely before you ask questions, and then send any you may have to jon@atari.archive.umich.edu. Jeff Weiner will only forward them to Jon, so please save him the time. Any questions about the archive or specific files go to weiner@atari.archive.umich.edu

For anonymous FTP: atari.archive.umich.edu [141.211.164.8]

User anonymous
<enter e-mail address in response to Password prompt>
cd /atari

For anonymous FTP in the UK: uk.ac.lancs.pdsoft

User pdsoft
Password pdsoft

This is a national public domain archive, available to sites in the UK only via JANET. Mail access is available from within the UK - send mail to archive-server@lancs.pdsoft for information.

For anonymous FTP in Europe: ftp.Informatik.Uni-dortmund.DE
[129.217.64.63]

Some selected Atari ST software is in the directory pub/comp/atari-st.

The mail server has also moved. Send an e-mail message to

info-server@ftp.Informatik.Uni-dortmund.DE

For anonymous FTP in Europe: cs.uni-sb.de [134.96.7.254]

Contains the most interesting tools of the german PD-scene, most of the GNU programs ported to the ST (including ports of emacs and bash and an extended version of bammis library for gcc) and also ports of software posted to comp.sources.unix, alt.sources and comp.sources.misc.

For anonymous FTP in Europe: archive.cs.ruu.nl
[131.211.80.5]

How to get ATARI-ST/index from the archive at
Dept. of Computer Science, Utrecht University:

NOTE: In the following I have assumed your mail address is john@highbrow.edu.

Of course you must substitute your own address for this. This should be
a valid internet or uucp address. For bitnet users name@host.BITNET
usually works.

by FTP: (please restrict access to weekends or evening/night (i.e. between
about 20.00 and 0900 UTC).

ftp archive.cs.ruu.nl [131.211.80.5]
user name: anonymous or ftp
password: your own email address (e.g. john@highbrow.edu)
cd /pub
don't forget to set binary mode if the file is a tar/arc/zoo archive,
compressed or in any other way contains binary data.
get ATARI-ST/index

by mail-server:

send the following message to
mail-server@cs.ruu.nl (or uunet!mcsun!hp4nl!ruuinf!mail-server):

begin
path john@highbrow.edu (PLEASE SUBSTITUTE *YOUR* ADDRESS)
send ATARI-ST/index
end

NOTE: *** PLEASE USE VALID INTERNET ADDRESSES IF POSSIBLE. DO NOT USE
ADDRESSES WITH ! and @ MIXED !!!! BITNETTERS USE USER@HOST.BITNET ***

The path command can be deleted if we receive a valid from address in your
message. If this is the first time you use our mail server, we suggest you
first issue the request:
send HELP

BITNET users:

LISTSERV@UOGUELPH.BITNET

Mail messages with the contents HELP will bring you some usage information
and GET PROG-A16 FILELIST will provide you with a list of files. Subscriptions
to INFO-A16 are also available on this server. INFO-A16 is a digest of
messages from comp.sys.atari.st.

ARCS
How do I deal with Archived files (.ZOO, .ARC, .LZH)?
==========

Files ending with suffixes .ZOO, .ARC and .LZH are archive files. They are
binary files which may contain one or more other files in a compressed format.
Archive files usually take up less disk space, and for this reason have
become quite popular for transferring large files via modem.

In order to extract the files from an archive file, one must use an archive program. Here are the correspondences:

ARC Use ARC.TTP
LZH Use LHARC.TTP
ZOO Use ZOO.TTP

ARCHIVERS
These programs are all available via FTP from the atari.archive server, in the /atari/archivers directory. Recommended files are:

arc602.ttp - version 6.02 of ARC, includes features to archive subdirectories and also include comments with files.

arc602.arc - contains documentation. UnArc using arc602.ttp.

arc521e.arc - older version of ARC. Used mostly by those who want speed, better compression, and don't care about archiving subdirectories. UnArc using arc602.ttp.

lharc.ttp - version 2.0 of LHARC.

lzh201i.lzh - Thomas Questors lzh utility. German documentation. UnArc using lharc.ttp

zoo21.ttp - version 2.1 of ZOO

zoo21bin.zoo - ZOO archive includes documentation. UnArc using zoo21.ttp.

ARCSHELLS
There are also several GEM programs which act as 'shells' for the archive programs. The most popular are Shareware offerings, also available on atari.archive server. They are:

arcgsh35.zoo - written by Rainer Klute, usefule for ARC, LZH, and ZOO archives.

arcshl30.arc - written by Charles Johnson, useful for ARC and LZH archives. Works with Questor's version of LHARC.

xshell.lzh - a very nice archiver shell, it includes the archive utility programs as well.

zooshl06.zoo - a basic shell for use with ZOO archives.

The GEM shells are recommended for inexperienced users (and appear to be quite handy for the experienced user as well!) They require a copy of the archive program -- in other words you need BOTH the GEM shell *AND* the archive program in order to use the GEM shell.

Documentation on the use of the archive programs should accompany the archive files mentioned above. To extract the files from any of the archives from a Command Language Interface, you can use the generic line below:

[arc/lharc/zoo] x <archive>

For example:

```
arc x arc602.arc
lharc x lzh201.lzh
zoo x zoo21bin.zoo
```

From the GEM Desktop, click on the respective TTP program and enter the following line at the parameter dialogue box:

ARC.TTP: xh arc602.arc

LHARC.TTP: x lzh201.lzh

ZOO21.TTP: -extract zoo21bin.zoo

The information above assumes that you have the TTP program and the archive in the same directory. Extracted files will end up in the same directory.

Source and binary code for archive programs have also been posted to comp.sources.atari.st and comp.binaries.atari.st. They are available via e-mail through the panarthea archive server. See Steven Grimm's posting for more information on how to obtain files from panarthea.

ERR
What does TOS ERROR nn mean?
What do the bombs on my screen mean?
==========

The information below was written, in part, by Darryl May, and posted on GEnie in January (of ????) by John Townsend. The original also appeared in the June 1988 issue of _Current Notes_ (122 N. Johnson Rd., Sterling, VA 22170). It has since found its way to me, and is being posted to comp.sys.atari.st as a service to readers.

Alan Pratt wrote to tell me that the basic information may be correct, but that it cannot be dubbed "official" unless it originates, on paper, from Atari. This makes sense, as electronic communications are easily modified, even accidentally.

Roland Waldi provided information regarding the difference between TOS and GEM return codes which appears to be correct. The tables have been modified to reflect his information.

The following is an unofficial list of the errors that can appear while you are operating your ST computer.

```
Error description return code alert box #
==================================================
OK (no error).....................0
Fundamental error................-1
Drive not ready..................-2
Unknown command..................-3
CRC error........................-4
Bad request......................-5
Seek error.......................-6
```

```
Unknown media...................-7
Sector not found................-8
No paper........................-9
Write fault.....................-10
Read fault......................-11
General error...................-12
Write protect...................-13
Media change....................-14
Unknown device..................-15
Bad sectors on format...........-16
Insert other disk...............-17
Invalid function number.........-32.............1
File not found..................-33.............2
Path not found..................-34.............3
No handles left.................-35.............4
Access denied...................-36.............5
Invalid handle..................-37.............6
Insufficient memory.............-39.............8
Invalid memory block address...-40.............9
Invalid drive specified.........-46............15

No more files...................-49............18
Range error.....................-64............33
Internal error..................-65............34
Invalid program load format....-66............35

The last code is the infamous "TOS error 35"!

Also, some unofficial information via Alan Pratt:

Notably, you should add -48: ENSAME (not the same drive, occurs when
you call Frename and the two names you give aren't on the same drive),
and -67: EGSBF: you can't use Mshrink to GROW a block of memory.

Those bombs that appear on your screen are error messages from
the 68000 micro-processor.

PAINT
What is the format for [x] paint program data?
==========

There is a periodic posting of ST Picture Formats, edited by David Baggett.
The file is on the atari.archive server under /atari/graphics/picfmts.doc.

GDOS
What is GDOS, and where can I get it?
==========

GDOS stands for Graphic Device Output System (at least that's what my copy of
STart, volume 1 number 1 said...)

There is a newer version, called FSMGDOS, which should be available
commercially from Atari. It is currently included with WordFlair II. FSMGDOS
uses scaleable fonts - you do not need to create a font file for every point
size. Current word is that the street price for FSMGDOS will be about $50.
The Lucida font family comes with FSMGDOS, and the output is very nice, even on
a 9-pin Epson printer. There are desk accessories which allow you to
manipulate available fonts, and also CPX programs for the newer Atari Control
Panel. For those who only have limited memory, a newer version of GDOS is also
included with the distribution. For those with investments in older bit-mapped
GDOS fonts, they may be used with the new version of GDOS or used as bit-mapped
(ie. non-scaleable) fonts within FSMGDOS.

You can get a copy of "Everything You Ever Wanted to Know About GDOS (and
more)" by Douglas N. Wheeler from the atari.archive server. The file is
/atari/programming/gdos.arc.

There is a German version of GDOS available from the atari.archive server.
The file is /atari/utilities/amcgdos.arc.

Currently, there are no truly public domain sources for the GDOS system files
or font files (at least those supplied by Atari). You can get these files
with many commercial programs, such as Degas Elite, WordFlair, etc. You might
also want to check your local user group to see if they received a copy of the

WordFlair demo program (also available on GEnie). The demo program appears to have the GDOS system and font files.

HAM
Where can I find Ham Radio software for the ST?
==========

Plenty of Ham Radio software is available for the Atari ST:

Morse code
Radio Teletype (RTTY)
Packet Radio (W0RLI BBS and K9AQ TCP/IP)
Satellite Tracking
WEFAX
Color Slow Scan TV (SSTV)
etc.

For more information contact the Atari Microcomputer Network:

Newsletter Editor - Gil Frederick, VE4AG
130 Maureen Street
Winnipeg, Manitoba
R3K 1M2 Canada
or
Program Librarian - John Adams, KC5FW
17106 Happy Hollow
San Antonio, TX 78232
U.S.A.
or
Tune into the weekly net Sundays 16:00 UTC on 14.325 MHz.

73,
John Langner, WB2OSZ

CLI
What Command Line Interpreters are available?
==========

There are a large number of Command Line Interpreters for the Atari ST. Some of the more popular ones include:

gulam the 'classic' cli, somewhat UNIX in flavor

BASH GNU Bourne Again Shell - available under MINT

ksh Korn Shell - available under MINT

gemini MUPFEL is the shell used by the gemini environment

okami a German shell with many useful utilities built in

pcommand an MS-DOS-like shell

Check atari.archive under /atari/cli or /atari/mint, or check one of the other FTP sites for files.

TEX
Is TeX/LaTeX available on the Atari ST?
=======================================

The TeX/LaTeX typesetting programs are available on the Atari ST. Check
the atari.archive server under /atari/tex.

Be advised that, although these programs produce high-quality printed
pages, they also require many megabytes of disk space in order to take full
advantage of the various fonts and device drivers. A 5-10 megabytes
should be sufficient for most applications, although when creating the fonts
using Metafont you may wish to have more disk space.

The latest version of TeX (3.1) has recently been made available on the
atari.archive server. The files are in a subdirectory of their own.

Graham Higgins recently wrote a message in comp.sys.atari.st indicating the
minimum files needed to get a working TeX/LaTeX system up and running on the
Atari ST. He said:

You'll need, at minimum:

The binaries for LaTeX/TeX :StTeXBin
The style files :StTeXSty
The font macros :StTeXTfm

If you want to screen-preview, you'll need screen font files (showdvi)
If you want to print locally, you'll need printer font files (dvifont)

Allow 5Mb.

There is also an 'installable' version of TeX and LaTeX, called CS_TeX. It
fits on eight double-sided disks, and provides fonts and device drivers
(including a screen drivers). A minimal number of fonts are pre-made, you
can use the MetaFont program to generate the full font set (but be prepared
to spend a lot of time, and have a lot of disk space available).

CS_TeX is available from the atari.archive server and from most of the European
FTP servers.

But wait, there's more. One can obtain a version of Lindner-TeX from the
DANTE group (an association of German speaking TeX users, who also have CS_TeX
available). Their server is rusinfo.rus.uni-stuttgart.de [129.69.1.12].

Also available is br-tex. Check for it on ifi.informatik.uni-stuttgart.de
[129.69.211.1].

LANG
Public Domain/Shareware languages...
====================================

There are a large number of programming languages available for use with the
Atari ST. Programmers seem to flock to the Atari ST, and if you know of a
language, you can probably find it, or an equivalent, for the ST.

68000 assembler/disassembler
abc
APL
BASIC
C
cross assemblers (z80, 6502, 68xx,8031/80xx)
Elan
FORTRAN
FORTH
ICON
LISP
Modula2
OPS5
perl
PROLOG
SCHEME

Check the atari.archive server under /atari/languages. Most other archive sites will have a language directory which you can also check.

GNUC
Is GNU C available on the Atari ST?
==========

The Free Software Foundation C compiler, commonly known as GNU C (or gcc) is avaialbe for the Atari ST. The minimal memory required to do any useful (i.e. beyond 'hello world') programming is 2.5 megabytes. A 4 megabyte system is recommended.

There is an extensive archive of the latest GNU C programs via anonymous FTP on atari.archive. GNU C is also available at cs.uni-sb.de and most other European FTP sites.

The most complete archive of FSF programs for the Atari ST, including gcc and g++, debuggers, shells, and utilities such as BISON and GAWK is the atari.archive server.

Check the files under the /atari/gnustuff/tos directory.

MINIX
Is MINIX available on the Atari ST?
==========

MINIX is a UNIX-like operating system for the IBM PC, XT, AT, 386, and PS/2, as well as the Apple Macintosh, Commodore Amiga, Atari ST, and later in 1991, Sun SPARC. It is available with all the source code for the entire operating system, the libraries, and nearly 200 UNIX-like utilities.

Demonstration disks for the IBM PC line and Atari ST are available for free via anonymous FTP for people on the Internet. A Macintosh version will be online soon. (If you can't wait, see below.)

To get a free demo disk and the manual, use ftp to connect to ftp.cs.vu.nl (192.31.231.42) and look in pub/minix/demo. The READ_ME file describes the contents of the directory and how to use it. Be sure to fetch and read this first. It contains important information.

If you don't have FTP access, you can buy the demo disk package from Prentice-Hall for $10 by calling (201) 767-5969 or FAX (201) 767-5625. Please DON'T ask me to send it by email. I have quite enough work already thank you. The ordering numbers for Prentice-Hall are:

- MINIX 1.5 IBM demo disk (0-13-582768-x) (in stock now)
- MINIX 1.5 Atari demo disk (0-13-582792-2) (in stock now)
- MINIX 1.5 Macintosh demo disk (0-13-582784-1) (in stock now)

Please note that although the demo disks are available for free on line, MINIX itself is copyrighted software and is not available on line. The demo disks are also copyrighted, but permission is hereby granted to upload and use them for evaluation purposes. The READ_ME file tells how MINIX can be ordered.

AS A COURTESY TO US, PLEASE DO NOT FTP DURING BUSINESS HOURS (EUROPEAN TIME). PLEASE FTP AFTER 11 A.M. EASTERN STANDARD TIME.

If you want to follow the MINIX discussion, read the comp.os.minix newsgroup, which is quite active and has almost 50,000 subscribers.

Have fun!

Andy Tanenbaum (ast@cs.vu.nl)

================================================

<This area under construction. Useful articles would be appreciated>

FLOPPY
What should I know about floppy drives and the ST?
==================================================

1.4 megabyte floppy drives will soon be available from Atari for MegaSTe
and TT machines. If you own an older Atari ST, there is a company which offers
a $199 kit (including floppy) to install and use the drive. (I will supply
the name next month, sorry...)
```

Note that Tos versions prior to 2.06 will not format a 1.4 meg floppy from the desktop.

GRAPHIC
How can I enjoy enhanced graphics on my ST?
==========

For stock STs, JRI makes a chip which allows a 4096 color palette.

There are a number of graphics boards on the market. Here is a first pass at listing some of them. The information is based on postings by Ben Gilbert and Jari Lehto within the past month.

C32 board by Matrix Datensystem (Germany)
* 800x608, 256 colors
* all ST/TT models
* 256k, 512k and 1meg versions

C75Z board by Matrix Datensystem (Germany)
* 1024x768, 256 colors
* Mega ST or STe, TT VME Buss

(Matrix GmbH has over 15, maybe over 20 with all versions, different graphics boards available, from hobbyist to professional, from CAD to GenLock and digitizing.)

ISAC board by Dover Research Company (U.S.)
* 1024x768, 16 colors from palette of 4096
* makes hi-res look like ST low res, just with a huge window
* Mega ST buss
* Dover Research Co. (612) 492-3913

The Imagine by Wittich Computer GmbH (Germany)
* 1024x768, 256 colors
* Mega ST only

(Versions available for all ST/TT models. Several possible resolutions. Reasonable price, but slow and not very compatible..)

Crazy Dots by TKR (Germany)
* 1024x768, 256 colors
* Mega ST only

(1280x800, 256 colors out of 16.7 million color palette. 1664x1200 for both 16 color and monochrome. True color option available. Mega ST, Mega STe and TT.)

reSOLUTION SuperVGA by GengTec (Germany)
* 8 resolutions, 320x200 through 1600x1200
* 16 colors without driver, 256 out of 256,000 with driver
* 1 mb RAM
* uses a standard VGA monitor
* Mega ST or regular ST
* available in U.S. from Rio Datel, 1-800-782-9110, (702) 454-700

(1024x768 is the highest resolution with 256 colors. Driver is called
Multicolor VGA option. Compatible with NVDI and Blitter. Multisync
monitor recommended.)

AlberTT
* like ISAC card, but specific for TT VME buss

MegaScreen
* 832x624 monochrome
* connects to MegaBus
* works with Spectre

Reflex
*1024x1024 with SM124 monitor
*2048x2048 possible with expansion
*usable with most big-screen displays

ODIN by Marvin AG (Switzerland)
* external expansion
* gives TT-resolutions to a regular ST

Cyrel
* RISC-based card
* extremely costly

Graphics cards for which information is sought:

OmniChrome board by Omnimon Peripherals

JRI GenLock

Atari/Lexicor 24 bit color card

Jari Lehto proposed the following recommendations:

Low budget SVGA - reSOLUTION
Professional high-end use Cyrel (or is it Cyrix?)
Hobby or semi-pro DTP Reflex
Hobby DTP MegaScreen
To obtain TT resolution ODIN

JOY
What joysticks work best with the Atari ST?
==========

The Atari ST works with joysticks with a 'standard' D-Socket. IBM-style
joysticks, Apple joysticks, and Nintendo joysticks will -not- work.

Some recommended joysticks:

Konix Navigator - "best .. if you want to use it for any length of
time"
Gravis - "responsive ... great for games like MidiMaze"
WICO - "strong reed switches, hard plastic and metal components"
Atari - "FAR more controllable and responsive than other, more durable
units"

MODEM
What should I know about modems and the ST?
==========

Any external modem should work fine with the Atari ST-series of computers. You will need to purchase or build an RS-232 cable. Be sure the cable is capable of establishing DTR with your modem, as many telecommunications packages check the status of the DTR line. (Ask your local hardware guru if you don't know what DTR is...)

The ST can connect to modems at up to 19,200 baud. Practically, you will purchase either a 2400-baud or 9600-baud modem. The cost of 2400-baud modems has dropped so much in the past few years that you should not even consider a slower modem. Believe me, modem speeds under 2400-baud are going to seem SLOOOOOOOW to you!

MONITOR
What should I know about monitors and the ST?
==========

The monitor is your connection to the ST. Without a monitor, you're typing blind. (Unless, of course, you have an RF modulator on your ST and attach it to your TV set. This is discouraged, as the bandwidth and resolution are pretty terrible for anything other than arcade games.)

There are three monitor choices for those of us owning Atari ST/STe equipment:

1. Monochrome monitors - these include the venerable SM124, one of the sharpest monochrome monitors on the market. Street price is about $150, used monitors should run around $80-90. You can also purchase a 19" monochrome monitor. This gives you a 'big screen' to play around in, and is best for work with DTP and CAD systems. The price is a bit high at $1500+, and you'll need a plug-in board, which is generally set up for the Mega ST machine.

2. Color monitors - including the SC1224 in all of its incarnations (JVC and Goldstar being the primary vendors). The newer monitor, the SC1435, has a 14" screen and stereo sound.

3. Multisync monitors - these monitors provide monochrome and color access in one monitor. The street price is around $450, about $100 more than a standard Atari color monitor. You need to reset your computer to change resolutions. In many cases, a nice little switch box is provided (or you can build one) which does this for you. Examples of multisync monitors include the OMNIMON RAINBOW MONITOR.

There are any number of monitor choices for those owning Atari TT equipment, although they all boil down to 'multisync VGA'. There 14" color VGA monitor from Atari is quite nice, as is the 19" monochrome monitor. Any standard 14" multisync VGA monitor will do as well. Forget moving your SM124 or SC1224 monitor to your new system, the cabling and electronics is just not going to work.

MOUSE
What do I need to know about the mouse and the ST?
==

You can use the standard Atari mouse, or you can purchase one of the slick new mice from a third party, such as the Golden Image mouse.

Got a sluggish mouse? Check the rollers in your mouse. Garbage collects on the rollers every time your roll it around that little mousepad you bought with your ST. This can eventually cause problems. The solution: pop open the mouse at the bottom (the little slide panel surrounding the rubber ball), take out the ball and then scrape the greyish gunk on the rollers you see. Replace the ball and slide panel, and see whether your mouse is now working a bit better.

PCEM
How can I turn my Atari ST into a PC emulator?
==

<This area under construction. Useful articles would be appreciated>

SPECTRE
How can I turn my Atari ST into a Macintosh emulator?
===

<This area under construction. Useful articles would be appreciated>

UPGRADE
Can/should I upgrade my ST?
===========================

The answer depends on the type of ST you currently have, and what you want to do in the future. Be aware that there are a large number of modifications one can perform on the venerable 1040ST, and that newer machines are coming down in cost so much that to obtain a certain feature it may be cheaper to purchase new than to upgrade.

1. Memory - most ST machines may be upgraded to 4 megabytes. The newer STe machines use either SIP or SIMM chips. Costs for memory upgrades on older ST machines run about $350 for 4 megabytes, at which point you can almost afford a 1-meg STe!

2. TOS - for those still running TOS 1.0, now is the time to consider an upgrade. TOS 1.4 has been around for at least 2 years now, and is -much- faster (and safer) for those using hard drives. TOS 2.06 is available as a hardware upgrade to ST and MegaST machines for around $150 from CodeHead Software. The 2.06 ROMs cost about $60. One can replace the ROMs directly in most STe machines. The MegaSTe is currently running TOS 2.05.

VIDEO
How can I interface my ST with a TV and/or television equipment?
==

1. Use a VideoKey, which takes RGB input and converts it into composite video which can then be fed into your TV system via VCR. The VideoKey is no longer manufactured, as the company, Practical Solutions, is no longer in business.

2. As an alternative to the VideoKey 'from the now-defunct Pratical Solutions', there was an article on page 81 of the December 1989 issue of RADIO ELECTRONICS which described a circuit to convert RGB to NTSC (suitable for that Radio Shack RF modulator). Incredibly the article was specificly written for the Atari ST!! so you will not have to adapt it to the 1040.

[info from an article by David Galloway dated 15 Jan92]

3. JRI offers a semi-expensive GenLock device for stock Atari ST computers. An address would be appreciated.

Hello and happy new year to all,

I've got a quick monitor question. Let's say I have one of the old atari XL computers. It has a monitor port in the back. Now, Let's say I have an RGB monitor, like the ST monitor. Is there a way to connect that monitor to the old XL computer. I believe the XL monitor port is for a composite monitor. Is there some kind of interface that will allow this kind of connection or can it be hooked up doing some direct wiring of pins from the port to monitor? Any insight would be appreciated. Thanks.

Mark

386. Atari Demos

387. Complete Atari Mega-2 St for Sale

Newsgroup: comp.sys.atari.st
Date: 1992-01-15 17:35:03 UTC
From: k_mullin@oz.plymouth.edu
Message-ID: <1992Jan15.173503.20053@oz.plymouth.edu>
Source record: 226723

The following system is for sale:

Atari Mega-2 ST w/ 3.5 floppy
Monocrome Monitor
Colour Monitor
Monitor Master
Acex 2400 baud Modem (Hayes Comp)
Supra Hard drive (30 megs)
Golden Image Mouse w/ pad
Various software

I'm asking $900 for the system but will consider any
reasonable offer. I will pay shipping if the system is bought
at the original price.

388. Re: Sozobon C

Newsgroup: comp.sys.atari.st
Date: 1992-01-15 18:06:36 UTC
From: john@castle.ed.ac.uk
Message-ID: <16606@castle.ed.ac.uk>
Source record: 226730

The "Heat and Serve" Sozobon distribution on Comp.binaries.atari.st really has been put together brilliantly. It installed more easily than many commercial software packages and certainly is the easiest thing I've ever used from the net. I havn't done any detailed testing but the "gemenv" program seems to be a superb solution to the environment variables problem for those us us who still use the desktop because we havn't found a truly satisfactory shell.

For good info on Atari (TT,etc.), I would suggest getting familiar and updated by reading some Atari mags. and going to a computer store also. The TT was just recently approved for Class B and should be shipping, if it hasn't already, real soon now, with the 1.44MB floppy. $2500 is not bleak, BTW - TT's start around $1500 for a base machine and you can add on later (i.e. - more memory, hard drive, etc.). I know of at least a couple of dealers that sell them here in the Chicago area. Also try Toad Computers (East coast) at 800-448-8623. They apparently have a good reputation. I have a catalog from them which is very good.

CUL,
Chuck

>P.S. Sorry, I have some experience with assembly programming for the
>ST; this is perhaps too simple for me.

The point is that 68000 branch instructions only have 16-bit offsets,
so you can't jump from the beginning of a 64K segment to the end.
Think about it: if you give branch an offset of $FFFF, it will intepret
the high bit as sign and convert to an ofset of -32K, NOT +64K.

For full generality, one needs to be able to jump from anywhere in
a segment to anywhere else in the segment. So segments are limited
to 32K without lots of trickery.

>how to redirect the unpacked files to drive A. If the unpacked files are written on the ram disk is runs out of memory .
>
>Thanks.
> Richard.

The ram-disk *is* a solution. Do this: copy zoo.ttp to your A: disk, and make sure the rest of the disk has plenty of room. Copy the zoo'd file to your ramdisk. Then use zoo.ttp with the following parameters:

e D:\zoofile.zoo

where D is the letter of your ramdisk. Zoo will read from the ramdisk and plop the uncompressed files to your A: drive. (This works with arc and lharc also, btw...)

For a big file like 500K, though, you would need at least a meg of RAM (I guess this might be obvious).

Charles.

I have some questions and hope someone can help:
I have a 1040Ste manufactured in '90 with Tos 1.6
Can I replace the old Tos with the New Tos 2.06?
Do I just replace the chips?
By the way how many chips are there and where are they located in
the Ste?
and finally where can I get the cheapest Tos 2.06? from Codehead?

Thanks

....

Oh no!! Is the ST really dead, as signified by the vacant space? Few years ago, when I was in the market for a computer, I had seriously considered the ST as an option.I had always been fond of Atari as an Atari 400/800 owner. The ST graphic interface I was fascinated with at the time,
was priced right, sufficiently fast, and played good games. So where is it now? Remember the ST-vs-Amiga thing? I suppose that was the beginning of the end for the Atari. The two machines were targeting the same audience, and Commodore clearly had the superior hardware. Waat disappointed me most about Atari was their reaction to this fact. They had ample opportunities to make up for the initial disadvantage. Instead, they just crammed more memory into the existing architecture (the Mega STs) as if that would solve the problem, then they wasted precious R&D $ in miscellaneous failures (remember the portable ST and the notebook DOS compatible that actually was featured in Terminator 2?). Then they went off into the video game industry (their place of origin) but never could regain their former stature. The sad tale of Atari computers is a modern tragedy indeed....

The following announcement was made available on GEnie by Bill Rehbock.

January 15, 1992

Atari Corporation Official Announcement

I am pleased to announce that Atari is making all of the released TOS development information available to the general public. We are making the kit available to fulfil the needs of programmers that already have purchased a third-party development package, Atari owners that are curious about the 'nuts and bolts' of The Operating System, and anyone else that wants to have a detailed understanding of TOS software development. If you wish, you may purchase the entire kit for $150.00 (U.S.) and also get one year of technical support from Atari via the private Atari Developer Roundtable on GEnie, 6 issues of the bi-monthly Developer Newsletter, ATARI.RSC, and one year of on-going developer kit upgrades. If you wish to renew after one year, there is a fee of only $40.00.

If you wish information on only certain aspects of Atari TOS computers, we also sell sections of the kit separately. The items that are available range from every issue of the developer newsletter since 1985, to the release notes for the exciting new STBOOK. Every detail a software or hardware developer could want is outlined, including MegaSTE/TT VME Bus specifications, STE DMA sound, FSM GDOS programming information, and more. Please see the order form for details.

You must purchase the $150.00 full kit to be eligible for on-going support. I'm sorry, but at this time, you may not purchase a part of the kit, and later "upgrade" to the support level.

Developers that are currently not registered with Atari, and have a commercial product on the market, or have a product in development, or have any other special needs requiring direct unlimited telephone support should sign up under the Atari Commercial Developer Program. There is an additional fee for this program, but there is no renewal fee required as long as you continue product development and support. (Educators, universities, and businesses may fall into this category.) Please contact Gail Bacani on 408-745-2022 for more information on the Commercial Developer Program.

The complete order form follows, outlining all of the documentation that is available. Please note that several items include disks

containing software relating to the documentation. We want to assure that you get the most out of your Atari Computer experience!

Sincerely,

Bill Rehbock,
Director of Technical Services, Atari Corp.

Included in this archive, please find the file, ORDERFRM.TXT. It outlines all of the documentation that is available, pricing and ordering information.

Atari TOS Developer's Kit -- Order Form -- January 4, 1992

Gribnif Software News Release January 15, 1992

```
==========================
= =
= Crazy Dots =
= Video Display Adapter =
= =
==========================
```

Gribnif Software has announced the imminent North American release of their new "Crazy Dots" video display adapter for the Atari Mega ST, Mega STE, and TT/030 personal computers.

The Crazy Dots video display adapter allows the Atari computer to drive a variety of VGA, Multi-Sync, and other high end color and gray scale displays. The adapter supports resolutions up to 1,664 x 1,200 pixels, and can display up to 256 different colors or gray levels at once.

Developed by TKR in Germany, the adapter is the fastest of its kind, offering the ability to switch the display's physical resolution from within any GEM program. Its numerous features include:

o Display up to 256 colors or grey levels from a palette of 16.7 million, in any resolution from 320 x 200 up to 1,280 x 800 pixels.

o Extended resolution support up to 1,664 x 1,200 pixels in monochrome, four, eight, and sixteen color modes.

o Software uses an exclusive "line-a-emulator", for maximum software compatibility (depending on the selected display mode).

o Mouse controlled hardware panning, which allows for the display of any virtual resolution, regardless of the monitor's maximum physical resolution.

o Connects to any Multi-Sync displays via a regular 15-pin VGA connector.

o Uses Tseng Labs's powerful ET-4000 graphics controller.

o Includes one full megabyte of display memory, with full Blitter access.

o Complete math co-processor support.

o Megabus model includes a bus "pass through" and socket for an optional math co-processor.

o Includes a special "Video Application Slot" for future expansions options, including: ECL adaptor, Genlock, and True Color display.

Crazy Dots is available in two models. The "Crazy Dots Megabus" model, designed to fit into Atari's original Mega ST2 and Mega ST4 computers, is available for $949. The "Crazy Dots VME" model, designed to fit into Atari's Mega STE and TT/030 computers, is available for $999.

To place an order, or for more information, please contact Gribnif Software directly:

Well if its the New Atari 14" monitor it could be posible,
they have A/V inputs..

I used the Commodore C64 (1702 ?) monitor that was made by JVC,
worked very well with the 8 bit Atari..

But I don't think its posible if its one of the older 12" monitors..

> 450 pounds = about $850US). The only thing it has going for it is that it
> "knows" about the TT resolutions and so gets the aspect ratio correct for
> them (unless you switch it to VGA mode using the switch at the back :-)).

This far to dear for the Atari monitor, they are only $450us, this is why
they don't sell them here in NZ, all you get here is some VGA monitor
with very pore sreen aspect ratio..

This another thing that Atari suffed up, why did they not use the
VGA standard ,will they ever learn

The TT monitor would end up costing some $1500nz, for that here
you can bye the NEC 3D, and most VGA's go for some $500nz and the Super
ones for $800/900nz..

Well the Evesham Micros has a nice looking SIMM one,
but it must be soldered in, there are NO ram upgrades
sold here in NZ, because 99.9% are of a plug in nature,
but they fall out and cause damage to the MMU sockets..

And Please get TOS 1.4, its far better, and less of a insult
in using a Atari...

Get some one to put SIMMS/SIPS in your machine, there are 2 files on how
to do it, they should be on A.A...

Can anyone help with :-

1. Are there versions of arc, zoo, lharc that run on SUN 4's or VAX?

2. Does anyone know where I can get the documentation for gdb?

3. Is there a program available that lets you use the ST as a
typewriter (v useful for filling forms)?

Thanks in advance,
Andy.Stratton.

412. MIDIFILE player program

Newsgroup: comp.sys.atari.st
Date: 1992-01-16 12:57:15 UTC
From: johnj@echo.philips.nl
Message-ID: <1992Jan16.125715.12084@echo.philips.nl>
Source record: 226820

```
================================================
I tried to crosspost, but it failed.
So sorry, if you see this posting more than once.
================================================

Hi everybody,

I post this mail to the net, as I received some mails asking
about the status of the MIDIFILE play program which I am
programming.

Yes, I am still busy making this midi program.
Yes, version 1.0 will be public domain!
Yes, the program comes with a help function,
however a manual can be ordered (see below).
I think beta testing (using vesion 0.9) will start begin februari,
and that 1.0 will be sent via usenet later that month.

#DEFINE ATARI_ST ON
As the initial program is written for atari st, I will try to
get it distributed via comp.binaries.atari.st and then to be
placed on atari.archive.
#DEFINE ATARI_ST OFF

#DEFINE MS-DOS ON
After finishing it for atari st, I planned to port it to MS-DOS too.
For use with MPU-401 interface (dumb mode).
The program also comes with a description how to make your own
(minimum) midi interface which is sufficient for this program.
If someone sends me programming details about pc-midi interfaces,
I might include those as well.
I think, I will start porting in april.
#DEFINE MS-DOS OFF

For those who missed the initial posting in december, here is some
information again:

The program is very nice for people who wants to do something
with computers and midi, but do not know what software to buy.
It gives you some ideas of the possibilities.
However, it also handy for people who already have midiprograms
(like me) and wants to spread his songs to other people (E.g.
for rehearsings) not having those nice professional midiprograms
with their hardware protections (keys, dongles, etc).
Furthermore, it is just fun!
There are loads of midifiles around on BBS boards and on
```

public domain floppies, which can be used by this program.

#DEFINE ATARI_ST ON
The program uses gem (on atari) and is fully mouse driven.
It can be run in color (medium resolution) and monochrome (high res.).
It will probably work with the newer screen modes as well, but I
have no possibility to test it.
#DEFINE ATARI_ST OFF

The program can play the songs stored in midifile format 0 and 1 (*.MID).
When format 0 midifile is loaded, midi events using different
midi channels will be handled as being on different tracks.
The program can handle up to 99 tracks.
The program allows certain events to be filtered.
Tracks can be muted.
Each track can be assigned to a midi channel for fast converting.
Each track can initialise the sound by transmitting a program change event.
Each track can initialise volume setting of the connected midi device.
Each track can have its notes transposed.
Each track can have its notes converted via mapping (for drum tracks).
The program holds two mappings which can be modified, loaded and saved.
Each track can be analysed with an event editor showing all the midifile
events loaded (incl. all midifile specific stuff like meta events).
Tempo of the song can be initialised.
Tempo of the song can be relatively changed (still following all
tempo changes which might be in the midifile already).

Some planned features for future versions of the program are:

Files can be saved, having the midifile format converted.
Changes can be made to events in the event editor.
During midifile loading, events can be filtered for min. memory usage.
Auto start playing midifile(s) at start-up of the program.
...

As written above, the program includes a help function
which gives some information how to use the program.
However, I am writing a manual (in English, German and Dutch)
which goes in the details of the program and gives hints how
to use the program in a practical way. The manual comes with
appendixes, including the following:
- An introduction for novice midi users;
- A list and explination of midi events;
- An explination (in detail) of midifiles.

The program is free, but not the manual (but, as said before,
you do not necessarily need the manual to use the program).

Oh yeah, I forgot:
The name of the program will be: PLAYBACK.

More news will follow next month when distributed.

John

413. Dired in Emacs on Atari ST

Newsgroup: comp.sys.atari.st
Date: 1992-01-16 13:09:14 UTC
From: uttwkt@utrcu1.civ.utwente.nl
Message-ID: <1992Jan16.130914.15895@utwente.nl>
Source record: 226824
Cross-posted to: comp.emacs,comp.sys.atari.st

Hello Netters,

Recently I installed Emacs 18.55 on my Atari ST. It works fine, except for dired. Dired.el compiles without problems, I can call dired without problems (there are no error messages), but my screen is empty: no files no directories. The status-line says: Dired, so that's ok.

Does anyone recognise this problem, or does anyone knows how to solve it? Please send your messages by email to hvdberg@math.utwente.nl

Thanks,

The mono dectect pin is taken to ground for mono and open for color.
In mono your montior must have 70Hz vertical. There is composite
availible on some STs (on all with modulator).

|> be, about 420 k
|>

I'm not sure if the EXTENTED MEMORY has got anything to do with
an ATARI, but normally a 1040 ST should have at least 800KB of
free memory. That number is of cource decreased for each TSR
(Terminate ans Stay Resident) such as the AHDI and every *.ACC
you are using. If you've got all six accessories installed and
are using quite a lot drivers or other AUTO-folder programs, it
may of course happen that there are only 420K left. You should
remove unnessesary accessories and drivers to gain more free
memory, since it is not so easy to install more in an 1040.

Greetings
TeSche

Frontier Software's 'Xtra-Ram' always gets good reviews. I installed one in my Mega 1 (TOS 1.2) and would strongly recommend it.

It's advertised (correctly) as a "solderless" upgrade, but this does mean that a few connections to some resistors are made using small jump-leads; I preferred to solder some wire connections instead.

See their adverts in the usual ST 'zines for details.

419. Re : fax software for the ST

Newsgroup: comp.sys.atari.st

I think that Michtron produce a package for sending/recieving faxes from your ST - if I remember correctly you can choose to purchase the software with or without the accompanying modem.

In the UK I'm sure that it is distributed by Microdeal in St. Austell, Cornwall, although I don't know of Michtron's distributor in Germany.

Hope this helps

Jonathan.

Yes most can be got from Atari.archive though I have yet to locate
Zoo201 only an older version that can be compiled on unix.

|> 2. Does anyone know where I can get the documentation for gdb?

With the souces on atari.archive I believe.

|> 3. Is there a program available that lets you use the ST as a
|> typewriter (v useful for filling forms)?

Yes there is, I always thought the idea of downgrading your computer to
a type writer rather silly but the program does exist. I's called E-Type
and is sold by Digita International. It even costs a wopping
39.99pounds. I would sugest you simply write a small program to do it.
It cant be that difficult.

>No requires adapter board.

Actually, for _MOST_ STe's, it's just a plug-in replacement.
If you have TOS 1.60 installed, you might need to desolder the
old ROM chips - but if you have socketed chips, you only need to
replace the chips and clip two jumpers (the chips are located
beneath the floppy drive).

>
>>By the way how many chips are there and where are they located in
>>the Ste?
I called Codehead and ordered the ROMs on 1/6/92, and
supposedly they will ship on the 22nd... Since the are a "dealer
item" (codehead's words), you can buy them elsewhere.

Jeroen, if you could say a bit more about PixelWonder, I am sure there are several of us who would like to hear it. How does it compare to Auto-Switch OverScan? And significant pro's or con's?

This can be done (and HAS been done) if the conversion program has some input from the developers of the program being converted. It's been over a year since I read about it, so I don't remember all the details (it might possibly have been XDOS?), but a company came out with a conversion program that could translate PC programs to run on 68000 workstation platforms. They then collaborated with several major developers to provide "hint" files for their important applications.

> Imagine, you had as much memory as a computer

Hmm? I can't compile a program without thinking either, but that doesn't stop perfectly working (well, almost! ;-) compilers from existing.

I think I have the pin-out for the Xformer cable somewhere, but it'd take me a month or two to find it <grin>. If you don't need Xmodem transfer there's a file on Atari Base (408) 745-2193 that shows how to hack a joystick cable to RS232 (RS232JOY.ARC) it'll go to 19,200 BAUD, but the ST can't capture that fast. For regular handshake type stuff, Xmodem, you can only go to 300 BAUD, but it will do two way transfers.

Source record: 226816

Well, I have always heard this question asked the other way around (ie can you use a `regular' monitor with an ST) but...

I have a friend who is `required' to get a for-real IBM compat. but wants to keep the color monitor from the ST (SC1224) to use with the compat... Any hacks, predone cables, whatever that does this?

Send email and I will summarize for the group if there is interest.

Thanks, Ron.

433. Making a null modem cable for 8bit to IBM/ST (how to)

Newsgroup: comp.sys.atari.st
Date: 1992-01-16 19:21:48 UTC
From: drp9500@ultb.rit.edu
Message-ID: <1992Jan16.192148.21397@ultb.isc.rit.edu>
Source record: 226828
Cross-posted to: comp.sys.atari.8bit,comp.sys.atari.st

I had posted a request for this information and I found it on a
local BBS. Several people asked me to share what I found so
here is the file on to build the null modem cable.

PRO Null Modem Transfers

1-17-90

Circular Logic
718-351-4304

It has recently come to our attention that many Pro SysOps are having
difficulty establishing a Null Modem transfer between their BBS and
a second computer, be it ST, IBM or XL.

It is quite easy and reliable as long as the correct cable is used.

The correct pinouts are as follows:

Note: should you mess this
up and blow up yourself or your neighborhood
we assume _no_ responsiblity! Get your pins right! They are labled
on any decent brand of connector. Here are views looking at the
'business' ends of the connectors-

Male DB9 Female DB25
1 2 3 4 5 13 12 11 10 09 08 07 06 05 04 03 02 01
6 7 8 9 25 24 23 22 21 20 19 18 17 16 15 14

Atari 9 pin to Atari 9 Pin or IBM/ST 25 pin

1 DTR *	1	20 Data Terminal Ready *
2 CRX *	2	8 Data Carrier Detect *
3 XMT	4	3 Recieve Data
4 RCV	3	2 Transmitted Data
5 GND	5	7 Signal Ground
6 DSR	6	6 Not Connected
7 RTS	7	4 Request To Send
8 CTS	8	5 Clear To Send
9 NOT CONNECTED		

*** Note IMPORTANT inorder to work with Pro and or Express, Tie
(short) pins one and two (DTR/CRX) together on the XL end
(and/or pins 8 & 20 on the ST/IBM end) This insures a Carrier
Detect for the BBS.

*Note: The only lines really needed are the lines on pins 1-5 on the
XL end
(WITH the pin 1 & 2 mod as above). This swaps the Send/Recieve
lines and forces a carrier detect for the BBS and grounds both
systems.

After hooking up the cable and matching baud rates (BAUD.CMD by
Circular Logic serves nicely to temporarly step up your
BBS baud rate for a null modem transfer) bang on the RETURN key
on the remote system untill the BBS 'sees' the keypress and
starts the normal logon process.
Programs tested to work on the remote are: 850 Express,
Express Cart,Flash, DualTerm, Procomm Plus.
-Hope this helped! -Tom & Bill

I have not built the cable YET, so I don't know if it works for sure.

Bob

>>
>
>Think it was $139.00 Was a bit higher than tos 1.4 at $90.00
>
Well shoot. For that you get TOS 2.06, the board that lets you
install it in your ST and a bunch of utilities (CPX, etc) on disk. (A
bit more price for a bit more stuff, tho CodeHead does have a monopoly
on it).
And since TOS 2.06 can plug straight into the STE, they probably
sell it for less. I don't see why CodeHead wouldn't sell 2.06 to STE
owners for more than $99. But then, it's up to them...

>
>The ram-disk *is* a solution.

For some, and only if you have enough memory. One reason I can't really stand Zoo is that, as far as I can figure, you can't redirect the output.
Say on a fairly large *.zoo file that would take up 700k or more uncompressed, the only way that I know of to uncompress on a 2floppy system is to make a ramdisk of around 1200k. This leaves 1meg, 2floppy owners out in the cold. Even 1 floppy 1meg owners could unarc an *.arc or *.lzh file that large with a few tricks. Some of the same is true for large self extracting archives.
Well at least you can extract files one at at time if they are ZOOed and small enough on a small system.

Another reason to not use ZOO on STs. It may be nice and solid on UNIX, but for most ST owners it becomes a hassel. I wonder why Steve Yelington likes it so much....

Maybe when arcshell supports ZOO, people will like it more...

Am I wrong in saying that you can't redirect ZOO? If so, I'd appreciate knowing how.

> For some, and only if you have enough memory. One reason I can't
> really stand Zoo is that, as far as I can figure, you can't redirect
> the output.

It places output in the current directory (and creates subdirectories
if asked to do so.)

But there's nothing that says either ZOO.TTP or the .ZOO archive need to
be in the current directory, or on the same drive.

> Say on a fairly large *.zoo file that would take up 700k or more
> uncompressed, the only way that I know of to uncompress on a 2floppy
> system is to make a ramdisk of around 1200k. This leaves 1meg,

> an *.arc or *.lzh file that large with a few tricks. Some of the same
> is true for large self extracting archives.
> Well at least you can extract files one at at time if they are
> ZOOed and small enough on a small system.

If you have two SF314 drives, put ZOO.TTP and the FILE.ZOO file on A:,
switch to B:, and run A:ZOO x A:FILE.ZOO. This is fairly simple and
straightforward if you're using a command-line shell. It's also
fairly simple with any of the several GEM-based shells that work with
ZOO.

It's a little harder with the standard GEM Desktop. There's a way to run a
program without switching to its directory, but I have to admit I'm not
sure what it is; I haven't used the old-fashioned standard Desktop for a
couple of years. I think you have to hold down a shift or alt key, or
perhaps the right mouse button, when clicking on a program in an untopped
window. Perhaps somebody who actually uses the old-fashioned Desktop can
comment. Anyway, after the .TTP dialog pops up, type "x A:FILE.ZOO"
and click on OK.

Note that to run ZOO from the Desktop, you MUST have TOS 1.4 or newer.
Previous versions will not pass the .TTP arguments correctly.

> Another reason to not use ZOO on STs. It may be nice and solid on
> UNIX, but for most ST owners it becomes a hassel. I wonder why Steve
> Yelington likes it so much....

Because it does what it's supposed to do, without mangling files or
crashing my computer, and because I can use it to exchange files with
folks who use other platforms.

> Maybe when arcshell supports ZOO, people will like it more...

Check the archivers directory at a.a. for shells that work with ZOO.

439. question: Notator & serial printer

Newsgroup: comp.sys.atari.st
Date: 1992-01-16 23:05:32 UTC
From: lewis@trantor.trl.OZ.AU
Message-ID: <1992Jan16.230532.7823@trl.oz.au>
Source record: 226835
Cross-posted to: rec.music.synth,comp.sys.atari.st

I have an Atari 1040ST and Notator 3.1, and would like to print out some arrangements I have put together. The printer I have is a Diconix 300W with a serial interface. My problem is that I do not seem to be able to get Notator to use the serial printer, even if I use the desktop tool to send printer output to the serial port.

Has anyone had any success, and if so could you email me and tell me how you achieved it? Thanks for any help.

>Das machine is nicht fur gefingerpoken und mittengrabben. Ist easy schnappen
>der springenwerk, blowenfusen und corkenpoppen mit spitzensparken. Ist nicht
>fur gewerken by das dummkopfen. Das rubbernecken sightseeren keepen hands in
>das pockets, relaxen und vatch das blinkenlights!!! ------------- :-) ------

The SST board will work with any variety of ST that has the 68000 CPU in a 64-pin DIL style, including the 260ST, 520ST, 520ST+, 520STF(M), 1040STF(M), and Mega ST 1/2/4 - but not any STE machine.

BUT: for anything but the Mega STs you will need a stronger power supply (at least 4 Amps on +5 Volts) and a different case. So if you have your machine in a PC-case with a strong power supply that will be fine.

For the standard, off-the-shelf 260/520/1040 models: sorry, no way.

Oh, if you should ask how I know: I am distributing the Gadgets products in Germany and have exhibited the SST board in August in Duesseldorf (if you still don`t know it: every year in Duesseldorf, Germany the largest Atari fair in the world takes place).

The information above was given me by Dave Small back then, to the best of my knowledge nothing has changed about the board in that regard.

|>
|> Zoo.ttp and the file just fit on the disk.

I suggest running a shell (like gulam). Put zoo.ttp and the archive file on floppy a:. Set your path to include A:\ . The following commands should work (I am showing the current directory as a prompt):

```
a:\> setenv PATH a:\
a:\> ls a:
zoo.ttp archive.zoo
a:\> cd b:
(computer says please put disk B in drive A. put your blank floppy in the drive.)
b:\> zoo -extract a:\archive.zoo
(zoo will extract the files into your current directory, i.e. the blank floppy)
b:\> ls b:
happy.prg happy.doc (etc.)
b:\> cd a:
(put disk a in drive a)
a:\>
```

That's it!

Good luck.

Atari HDX version 5.0 is available on CompuServe, but to registered developer only.

We've asked Atari for permission to release it for everyone, but as yet we've had no response.

When Atari decides to let everyone have it, it'll be available in the Atari Productivity Forum.

BobR

(Anyone who might want to speed up the process might want to invest in a call to Bob Brodie at Atari Corp and ask for HDX 5.0)

|>
|> Can anyone help with :-
|>
|> 1. Are there versions of arc, zoo, lharc that run on SUN 4's or VAX?

Yes, yes, yes.

I have arc and zoo on my sparcstation and they run fine. For some reason unarced *.prg files that are then downloaded with binary xmodem do not run. I am not sure why. The files are called zoo.tar.Z and arc601.tar.Z and are available on LOTS of ftp sites in the unix areas. The best way to find a site near you is to use an archie server. To get started, telnet to quiche.cs.mcgill.ca (132.206.51.1) and log in as archie (no pass required). You can then find the address for a european archie server. Archie will take a file name and then search a database and tell you everywhere that it knows about that has the file you want.
Good luck!

Btw, unarcing on a sparcstation is almost instantaneous! You'll love it!

Source record: 226841

I am beginning to install gcc, and have a couple questions. I know it uses a lot of memery, I have 4 megs installed. Is this enough for large applications? Or will this too run out pretty quickly?
I did get hello.c to compile correctly, but when I tried it on some of my own programs, it appeared that it did not like include files that were called from other include files. Is this true? I am using mupfel, and not sure if this had anything to do with it, but I think I have all then env vars set, I read something about SH.TTP, but could not find it anywhere to use in conjuction with mupfel.
Any ideas on these things?

No doubt about it. Just look at the virtual lack of new posts to
comp.sys.atari.st on a daily basis as compared to the multitude of
different comp.sys.amiga.etc etc etc posts. Nothing else points out so much
as to the demise of the ST as thiss does. Even when there ARE are few
new messages, a good portion of them are from people trying to dump their
Atari equipment as fast as possible. Inour market, about the only way to
get rid of an ST is to give it away. I feel EXTREMELY lucky to have dumped
my STe for the measly sum of $350 (including a monochrome monitor and an
external drive) about two months ago. I'm positive the price I could
receive now would be even less.

There's not even a glossy independently produced magazine published in the US
for the ST.

Message-ID: <sourada.695618693@pv178b.vincent.iastate.edu>
Source record: 226844

This looks like pretty good news for the ST world. First, it allows some people who wouldn't normally be able to get ahold of the documentation (because they didn't like the confidentiality agreement (see below), or they didn't have the money to buy the entire thing, etc.) to get it. Second, it should help to get a more open atmosphere on Usenet for people to get answers, since there is less restriction on what can be said (see below again). Third, maybe a Real Publisher will decide to pick up the docs and clean them up a bit and get them into BOOKSTORES! Good decision for Atari!

Here's below: In case anyone is wondering (I was), I called Bill Rehbock and he said that anything published in the kit(s) mentioned in his article is now open. In other words, the confidentiality agreement does not bind these documents. I suppose I could have assumed that from the wording of the agreement, but I didn't want to assume :-).

Later,
Steven Ourada

452. Zmodem and UNIX

Newsgroup: comp.sys.atari.st
Date: 1992-01-17 03:33:27 UTC
From: remyh@cco.caltech.edu
Message-ID: <1992Jan17.033327.4435@cco.caltech.edu>
Source record: 226846

I'm having trouble sending and receiving files using zmodem. Here's my setup:

I'm on a 1040ST, running Uniterm. I'm hooked up to a 9600 baud port
of a network server that is hooked up to a Sun Sparcstation running SunOS 4.1.
I've tried xyz2.01, sz and rz 1.7 and 1.8. I've occasionally had success with
them, but very little. When I use sz/rz, I get 'bad subpacket' length, though
I've altered packet lengths to kingdom-come. When I use xyz, I get 'bad file
number' or something, which says in the docs that it's 'A serious bug in XYZ
or TOS.'
I've turned Xon/Xoff on and off, tried the -e option with sz on the
UNIX end, etc. Any suggestions?

Sick of Kermit,
remyh@cco.caltech.edu

Source record: 226856

This is truly a great event in the history of Atari, since the Tramiels took over anyway. I believe there was such documentation made publicly available in the days of the Atari 8-bits, at least for a while. One thing I have envied about Amiga users is that the technical information about the OS, etc. is publicly available. I've heard that some of the most incompatible software is PD and Shareware, most likely because the authors did not have access to the developer's information. I agree with another poster. I think it would be good to get these docs into dealers, rather than just ordering direct from Atari. Maybe the support disks should remain only available from Atari, but I'd like to see the docs go (more) public.

I think the release of these docs has been one of Atari's better decisions. Good thinking guys, even if it should've come out several years ago (in my opinion).

>The harware emulations are more than a chip. They are complete PCs
>on a board that connects to the 68K and takes over the buss except
>for one that plugs into the DMA port. Most are more expensive than
>buying an XT.
>

Wrong!
In Germany, there are three companies producing/importing emulators, but only
the 'Supercharger' is a full PC connected via DMA.
The products of Sack and Vortex are built into the computer, they take place
on the processor socket and the 68000 has to be put onto these boards.
These boards do not have any RAM, no slots and nothing else that would
qualify them as full PCs.

The newest board by Sack has got a 16Mhz 80286, while the latest Vortex
board (MegaSTE only) is a 80386SX 16Mhz with co-proc. socket and optional RAM
(up to 512 KB, I think).

Prices are ~500DM (80286) up to ~800DM (80386SX).

From: gjh@hplb.hpl.hp.com
Message-ID: <GJH.92Jan17105109@ghiggins.hpl.hp.com>
Source record: 226862

I recently had occasion to check out the (German) implementation of Common Lisp recently posted to A.A.

I had acquired a soft copy of the CL code which appears in Charniak and ??? (I forget)'s book "Inside Case Based Reasoning". Much to my surprise, the ST CL implementation happily compiled and loaded it all, then ran it without problem.

I became a bit more ambitious and tried cascor1, a Cascade-correction NN -- again, it read it in quite happily and ran it without murmuring.

Anyone interested in using CL on the ST may well find this implementation of interest.

It won't run under apratt's init.prg under MiNT, but will with gulam. I guess that it's best run from the straight desktop (more memory available), a user-specifiable external editor can be called from inside CL --- this provides a fairly basic, but still functional development environment.

Nice piece of work guys, any chance of an English version?

Cheers,

Here at the University of Bradford we have some Atari 1040STFMs that are used as terminals onto a SUN network. When using the the matrix manipulation package Pro-Matlab via the Atari terminals we make use of the Tektronic graphics emulation to display plots...I've not seen it used for anything else.

I assume that any program running on our SUN system that required a Tektronics graphics terminal could make use of this part of Uniterm.

|>And 32K in each direction is still 64K!
|>
|> Leo.
|>
|>P.S. Sorry, I have some experience with assembly programming for the
|>ST; this is perhaps too simple for me.
|
|The point is that 68000 branch instructions only have 16-bit offsets,
|so you can't jump from the beginning of a 64K segment to the end.
|Think about it: if you give branch an offset of $FFFF, it will intepret
|the high bit as sign and convert to an ofset of -32K, NOT +64K.
|
|For full generality, one needs to be able to jump from anywhere in
|a segment to anywhere else in the segment. So segments are limited
|to 32K without lots of trickery.
|
|Dave Baggett
|dmb@wam.umd.edu

OK, this seems to ask for an example:

mid equ init+32768

init
lea.l mid,a5 * Use a5 as program text pointer
bsr atstart
rts

atstart
...do stuff here...
jmp atend-mid(a5)
...etc...

...other functions here...

atend
...do stuff here...
jmp atstart-mid(a5)
```

Note: atstart and atend may be up to 64K apart, _and_: no trickery at all!
atend-mid is between 0 and 32767, and atstart-mid between -32768 and 0.
All symbol (addresses) in the 64K segment are accessed as symbol-mid(a5).

Leo.

4 Meg ought to be enough for all applications, even compiling the compiler
itself.

> I did get hello.c to compile correctly, but when I tried it on some of
>my own programs, it appeared that it did not like include files that were
>called from other include files. Is this true? I am using mupfel, and not
>sure if this had anything to do with it,

I've been using gcc together with mupfel without any problems.
What you describe sounds like a problem with the dir structure and/or
environment variables. To say more, I'd have to know the exact layout
of your directories, the error messages gcc put out and the exact
setting of your environment variables. Run gcc with the -v (verbose)
flag to get maximum output to get more info.

Oh, btw, do you have a

set errorfile con:

line in your mufpel.mup? If you don't, you are not likely to see any of
the error messages gcc puts out, and things could get a little confusing :-)

[rest deleted]

Hope this helps

>Jane Fothergill
>(J.S>Fothergill@uk.ac.newcastle)

As I understand it when you boot up a 1040 without desk accs and any auto folder programs you should have about 888K of free memory remaining, at least thats what my old 1040 always had.

If you've only got 420K then I suspect that some of your memory may not be working.

>

On the SUN system here at the University we have arc and zoo they both run on SUN 4's.

I'm not sure where you would get hold of arc but I got a Unix version of zoo from the NPDSA at Lancaster University. In the directory /tools they have UNIX and VMS versions of zoo v2.1 (latest version).

I've not seen a version of lharc for Unix but I and a number of people that I know would be interested in hearing if anybody out there has got a version.

If you have to use "hint" files by the developers of a program why not
just ask them to compile the source-code on your machine?

>> Imagine, you had as much memory as a computer

Of course you can! There exists an algorithm for compilation. So you
do really not have to "think" when compiling a program, you just have
to follow some rules.

>Is there a way to remove the ST keyboard, add wire, and use it separately,
>like the Mega's? Will the whole plastic board just sit there, ugly and all?

Mark Tilden, (mwtilden@watmath.waterloo.edu), one of the
hardware gurus at waterloo has done this. His setup includes an
ST in a tower box with a detachable keyboard. He hacked away the
surplus in the 1040 case and added bits of plastic scavanged from
here and there, to make a nice keyboard case from the old 1040.

Flippin' eck! That's more than you get with Atari Corp (UK)'s DocSupport
scheme... with that you just get four ring-bound good-quality photo-copied
manuals plus two disks (HDX 4.X, TOS 1.4 and STE utils + "Demonstrator"
which doesn't work on the TT). This costs 99 pounds stirling! No telephone
support, no nothing else!

Yes, it looks like your network server messes around with the
data. It either removes or translates certain characters in
either direction. Try kermit with the 7-bit option, and check
whether that helps.
Cheers, Louis

|> appreciate knowing how.

What do you mean be "redirect"? I assume you want to write the extracted files to a different directory than that one where the zoo program resp. the zoo archive resides. This can surely be done by setting the current directory to the folder you want the extracted files before zoo is started.

You can do that easyly with Arcgsh 3.5, the archiver GEM shell. Arcgsh 4.0 ist coming really soon now and will support zoo, arc, lharc, tar, shar, compress, uud, and uue.

You can also replace the keyclick(s) with digitized sound(s) using Digital Keyclick, available from atari.archive.umich.edu in

atari/sound/players/digistuf.arc

You can have your keyclick play through the ST speaker, Hippo digitizer, or ST Replay digitizer.

This archive contains a bunch of other stuff too (listed below).

Dave Baggett
dmb@wam.umd.edu

atari/sound/players/digistuf.arc contains:

From: nabeel <EENG6801@RyeVm.Ryerson.Ca>
Message-ID: <92017.121024EENG6801@RyeVm.Ryerson.Ca>
Source record: 226639

I don't know if this works on the Atari monitor but motorola makes an
chip that converts composite->rgb. on some st s there is a chip that
does the opposite converting rgb-> composite. It's not just a matter of
wires since atari monitor wants r,g,b,vert sync,horz sync all separate.
if you can separate those 5 signals and feed them to the atari monitor
then it should work.
Carlos Varela

You can add icons to DESKICON.RSC by using a resource construction
set. I used the RCS that came with MWC to add and edit my TT's icons.

|> the way, is the file that stores the icon shapes called DESKICON.RSC?

You've heard right! It is possible to add more icons.
Didn't you see the files DESKICON.RSC and DESKICON.DFN ?
(I have a German version of a Mega STE and they exist)
I added many new icons: tc, shell, arc, ibm-exe, img ...

To do so you need one or two things:
A resource construction set with built in icon editor or
an extra icon editor which can create data in the format
that your own RCS requires. I use DRI RCS 2.0 and a PD -
icon editor. DRI RCS requires data in C-code.

If you've added icons to deskicon.rsc you can install
them after a reboot by clicking on (I don't know your
desktop) 'install icon'(?), typing the name of your
programs (like "*.c") and clicking up or down arrow
until the new icon occurs.

But note:
The file deskicon.rsc can be max. 64k large, be sparing-
ly using this feature.

If there are any Q's, please PM.

Yes, there have been failures I agree (yes the STacy never became popular as far as I can see), but the Portfolio? Seems to me it is still widely available in dealers and if I had a dime to my name I'd buy one, right after I bought the Lynx and a new Mega STe. And perchance have you heard of the new ST Book? Seems to me Atari is not doing too bad as far as coming out with up-to-date products, it's mostly a marketing problem (which includes the consumers, i.e. video-game bias). Atari has come out with some very high quality, high power stuff, and looks to me like they have loads more of it this year. (For example, MTOS, ST Book, not even to mention the great 3rd-party stuff like graphics cards and accelerator/emulator possibilities)

>>industry (their place of origin) but never could regain their former stature.
>>The sad tale of Atari computers is a modern tragedy indeed....

Yeah, ok so they're not the world leader in computer sales $$, so what? Just because they are a smaller less well-known company now doesn't say anything about the quality of the computers, I think it's great they are still going strong and coming out with lots of new advanced products (like the TT and STe). I don't see any bankruptcy notices being filed so maybe we should wait before nailing down the coffin... :)

>

What does the number of amiga posts have to do with Atari? The sheer
fact that more amiga users (and yes you're probably right there are more of
them) post to the newsgroup doesn't say anything about the demise of Atari, nor
do I consider 75-100 messages per day a "lack of new posts."

>new messages, a good portion of them are from people trying to dump their
>Atari equipment as fast as possible. Inour market, about the only way to

Of course it would be less, all computers are like that... It's a common
fact that computer resale prices are low compared to new price, this is not
a feature of Ataris only (besides how can you expect the resale price to stay
high anyway when the new prices are always dropping?)

>
>There's not even a glossy independently produced magazine published in the US
>for the ST.

Well that may be so, but have you ever heard of the other magazines published
here? Perhaps Current Notes or ST User or something (last I heard there were
about 5 or so US Atari magazines)? Or does a magazine need to be a
multi-billion dollar publishing operation to have any value??? Seems to me
Current Notes is just as good, probably better than, for example, STart ever
was, IMHO, it just happens they don't sell it at every corner 7-11 in town
(Oh no, might have to get a subsciption, scary thought)...

Well ok, my final note is : why bother reading the Atari newsgroup if it is
so dismal, you're so fast to get rid of your STe but can't help to spread
doom among the others who have decided they like their Ataris (and no this
is not a 'love it or leave it' comment. :-) It's as much a matter of

personal choice as anything else. IMHO, the Atari is a great computer for all sorts of stuff, I only wish I had a more powerful one (like a MSte), although my '85 520 hasn't failed me yet... What with Neodesk and all the really good applications, utilities, programming languages, and increasing 3rd party cool stuff, Atari has a good thing going. So maybe they aren't going to exceed IBM's sales in 1992, who really cares????

(sorry for the message length, it got out of hand.. :-)

Just put the zoo file in one directory, say b:\, then cd to the destination directory, say a:\. Follow that by zoo x b:\xyz.zoo and the files will be extracted to the current directory. Of course you need a command shell to do this, but then why should every program contain code to deal with this? A decent graphical shell could also manage this by setting directories appropriately.

I just discovered that a file server at the university of
Regensburg/Germany seems to have an arcshell which works with ZOO,
ARC, UUD, and SHAR.

If you are interested :
The address is rrzs2.rz.uni-regensburg.de (132.199.1.2)
The program is called st-arcsh,
it's in the directory software/atari/arc.

Hi,

I need a program to convert output from 1stWord+ (ATARI St) to
Word 5 or Works (PC). Pure ASCII will work, but isn't sufficient.
The program should preserve the format info, the letter style etc.

Program for ATARI or PC will be ok.

Can anybody help ???

Thanks
Reinhard

This sounds reasonable (not that that counts for anything). What with
handling ACSI SCSI and ESDI, and trying to take advantage of any special
features available, HDX 5.0 is complicated enough to benefit LOTS from
documentation.

> one allows 32 character object names?

Basically Sozobon 2.0 is Sozobon 1.2 plus the SozobonX extended object file format (long identifiers), some bugfixes, and source code that can be compiled on a variety of platforms (for cross development of ST binaries).

1.33i (Heat and Serve) is Sozobon 1.2 with even more bugfixes, much optimization, no source code, a long list of revisions to the user interface to allow it to be executed without a command interpreter, a completely new MAKE, and a long list of enhancements to the compiler itself -- several pragmas, some ANSI preprocessor features, C++ comments, intelligible error messages, etc. In addition, it comes with a nearly foolproof installation program and a GEM environment-setting utility.

(As posted previously, the 2.0 linker can be modified to work with 1.33i and, in conjunction with the 2.0 assembler, 1.33i can handle long external identifiers.)

> Is either ANSI compliant?

Neither compiler conforms to the ANSI standard; neither compiler supports function prototypes.

> Which is going to be the new Sozo "standard"?

I expect both to be around for awhile, with descendants that probably will diverge.

> And what's that on
> my shoe?

Hard to tell, but if you here, it'd be melted dirty ice and road salt.

-
-"Does anybody know how to turn the key 'blip' off and on whithout
-using the control-panel accessory?"
-
-1. Set the keyclick "blip" to off with the Control Panel (wait, this
-gets better.) Save desktop (from TOS.) When you boot with the disk you
-saved DESKTOP.INF on, the click will be off from square one. Beats me if
-this will work with a hard drive; I don't have one.

I found a nifty little AUTO program on one of the commercial services (Delphi or GEnie). It has two reasons for living: it lets you kill the key-click without having to install a control panel, and also fixes the aspect ratio for screen dumps so you get the whole screen to fit on your printer. I'll find out the name if anyone cares.

That may be a longer wait than you think. According to the January, 1992 issue of AtariUser, the TT040 will _show_ this spring at CeBIT, but won't acually hit the shelf until 12 to 18 months after that.

Regarding "broadcast graphics resolution", that probably means something like 1024x768, like the supposedly upcoming 24-bit board mentioned in c.s.atari.st.tech (I hope it's true, and also available for a "humble" TT030 :-)).

On the bright side, at least Atari is finally being honest about when their products will _actually_ be available!

>I just gave my wife my old 520 so I need something new. What about the
>TT? Is it fast (or slow like the Amiga 030)?
Getting whacked by Amiga lovers leads me to clarify this. A good 68030
design (HP/Apollo) seems to be able to run 350 dhrystones per MHZ of clock
(i.e. 7000 dhrystones at 20MHZ and 17500 drystones at 50MHZ. Next gets 280
drys/MHZ, which is still good. The Amiga 3000 gets 120 drys/MHZ. These
numbers are computed from data in UnixWorld. I would guess the root of
the difference is primarily memory system design (memory speed, burst vs.
non-burst, etc). So my question *really* meant, did atari do a good job
on the design of the TT memory interface, or perhaps how bad a job did
they do? I did not mean to denigrate Amigas or glorify Ataris.

One of the differences is that TOS 2.06 is capable of dealing with the new
1.44 Mb disk drives in the newer TT's and Mega STe's, also I think there
are probably some minor bugs that have been fixed, I don't have any firsthand
experience though so I don't know the details...

>2floppy owners out in the cold. Even 1 floppy 1meg owners could unarc
>an *.arc or *.lzh file that large with a few tricks. Some of the same
>is true for large self extracting archives.

I'll assume you're not using a CLI, otherwise you wouldn't be having any problems with redirection. So you must be using GEM. Here's how you would extract your above problem using the GEM Desktop:

1. Make a ramdisk big enough to hold zoo.ttp and copy it there. We'll call this drive M.
2. Place the floppy with the 700K archive in drive A.
3. Place a blank formatted disk in drive B
4. Open a window for drive M
5. Open a window for drive B
6. With the drive B window active, hold down the right mouse button while double clicking the left mouse button on zoo.ttp (in the inactive window).
7. Type 'x A:\foo.zoo' and click on OK.

Zoo will now extract the contents of foo.zoo into drive B.

> Well at least you can extract files one at at time if they are
>ZOOed and small enough on a small system.
>
> Another reason to not use ZOO on STs. It may be nice and solid on
>UNIX, but for most ST owners it becomes a hassel. I wonder why Steve
>Yelington likes it so much....

Let's see...
To extract an archive with arc you use:
arc x foo.arc

To extract an archive with lharc you use:
lharc x foo.lzh

To extract an archive with zoo you use:
zoo x foo.zoo

So what's the hassle? For the basic operations the programs all operate about the same. Too many users are overwhelmed by Zoo's multitude of options, even though they'll probably never have to use them.

> Maybe when arcshell supports ZOO, people will like it more...

It'll never happen. If you need a graphical shell use Steve Yelvington's ZOOSHELL.

>Am I wrong in saying that you can't redirect ZOO? If so, I'd
>appreciate knowing how.

You're right you can't redirect Zoo but you don't need to, since your CLI or the Desktop will take care of it.

499. IBM emulation

Newsgroup: comp.sys.atari.st
Date: 1992-01-18 01:15:52 UTC
From: chan@cs.unr.edu
Message-ID: <2572@equinox.unr.edu>
Source record: 226884

In article <OKES.92Jan8220607@solb1.essex.ac.uk> you write:
>Yes, there is now a 386SX emulator (by Vortex, I think)
>
> Simon.

Is it true? Does Vortex have a 386SX emulator? Will it work with my system?
I have a MegaSTe (4) and a SC1435.

I am interested in buying a 386SX (still keeping my precious ATARI).

BUT, if it's true, that there is a 386SX emulator, I can probably save some
money...

I was looking at:
386SX, extended VGA (1024), 2MB mem, memory cache, 40MB to 80MB HD,
3.5 HD DD, 5.25 DD, some telecom, and Windows 3.0 (yeah, I know),
16 or 20 MHZ etc...
All this can be had for around $1350 mail order.

Some questions:
1) Since ATARI is going to be selling kits (ST) to convert to 1.44
meg drives and can read IBM format (?), would this let the 386
emulator read directly from the converted drive?
Or do I have to buy a separate drive (maybe 5.25 or 3.5)?
2) Can I use my present monitor (SC1435) with the extended VGA?
Or do I need to buy one? (though, they are pretty cheap)
3) How is the compatibility (IBM-wise)? Sound? Usage? ETC...?
4) How much will it cost?
If it is going to exceed $1000, I'd rather buy the 386...
(software, hardware (?), monitor, drive) <= emulator

Please respond to me even if they are rumors...

Thanks in advance...

500. Re: Atarians! Where Are You?!

Newsgroup: comp.sys.atari.st
Date: 1992-01-18 01:32:59 UTC
From: Azog-Thoth@cup.portal.com
Message-ID: <52930@cup.portal.com>
Source record: 226889

Most of this is IMHO, and a severe case of babbleitis. And besides the fact that I hate this news reader, where it aint easy to quote text...

It kinda seems like Atari itself is to blame. Almost like the will to live has been knocked out of them. They released new stuff every now and then, and kinda sorta forget about the people who buy their products...

It takes them a long time from announcement to shipping on new products. How many delays where there from announcement of the Mega-STes to shipment? Also, theyre a bit late in the market place. They took too long to put an entry into the 68030 market, the TT, and by the time they did, other machines had already gotten a firm foothold. Not just Amiga, but other machines.

Also, there isnt any advertising or marketing of any kind that I ever see. True, the Amiga doesnt get much that I see, but some is better than none...

Seems that the early image of Atari as a game maker and only a game maker is still in effect. If Atari could get their name out in the market place with a bang and some tangable evidence, that might change. But they need a solid product with potential sales. The TT is a great machine, but lacks multitasking. Which face it, most everybody wants these days. Power sells. Dont push the MIDI part as much, altho it is a great sales technique. They need something to catch eyes. Amiga could use this too. I dunno about you, but I never saw an office where everybody uses Ataris or Amigas (execpt maybe publishers and the manufactures of the respective companys) What you see is Macs and PCs.

Me, I recently got a brand new 520STe, which I quickly upgraded to 4mb (does that make it a 4180STe with the same numbering system?) And I just sent out a check for TOS 2.06

Now, I wouldnt mind an Amiga, but I wont ever really buy one myself. Unless its in a trade for other stuff I have... Why? Its got a lot of things I like, but the real turn off is the user base. Its like a religion, or a cult. I know lots of people who mock the Amiga because Amiga owners go around saying stuff like "My Amiga is better than blah blah...". Instant turnoff. But the Amiga has more activity in all aspects, like new hardware, new software. But like I said, the users should lighten up a bit. Say to any Amiga owner that you have an Atari, and watch

their face....

|> So why do you blame ATARI if you havent seen an expansion ...

I guess my point wasn't clear. I don't criticize the upgrade board design concept. In fact I advocate it. By having a daughterboard design, if you want more memory than it can hold, you just get a new board (like the german board which expands to 128M). With simm sockets on the motherboard you are locked in to some maximum memory.

I am fully aware that DRAMs must be constantly refreshed (thus the "D") and that the upgrade boards have SIMM sockets. My complaint is that the memory board is an option. Expandability should be built in. These boards seem like they wouldn't cost more than $50-60US to make. Why not include them in the standard TT? Everyone else includes expandability into their machines. Atari can too.

Is it true that I need sh.ttp to use gnu's make? I tried substituing
SHELL= gu.prg (gulam) in the makefile, but it then says can't find gulam.g
which is right beside gu.prg. So, where can I find sh.ttp? I haven't been
able to locate it.
When I don't add the shell= line to the makefile, the cc environment
variable in my gulam.g file must get cancelled, as makes then cannot find
the cc program, which I have defined correctly (I know this since I can
type cc ... where the makefile is and it will indeed find the gcc prog.

OK. Here is another atarian in Japan.

> Commonest Japanese characters are coded as 16 bytes per character, which
> is 8x16 dots and the total number is usually 5000, not 256.

Commonest Japanese characters are coded as *16bits* per character.
16x16 dots kanji font is usually used. 14x14 font (famous k14 font in X11
distribution) is tolerable, but too miserable. Unfortunately, there are
two major Kanji encoding in Japan, MS Kanji code and EUC (Japan version).

Yes, because ST display memory resides on main CPU address space, it is
very easy to display any kind of fonts. But japanese text inputting is
totally other story. It is not happy work to make a computer capable of
Japanese text input.

> I just cannot understand why people buy expensive MacII's instead of
> Sun's ELC or IPX: maybe they have some nice software in mind.

Maybe the ordinaries would love to own a personal computer, not a WS.
Hahaha...
Macintosh sales in Japan market is remarkably increasing. It seems to me,
people would like to buy Macs as their 2nd computer, and previously
they used to own NEC PC9801s, which was best seller PC in past days.
Becoming a Mac ower is "trendy & fashonable" in Japan, so I have heard.

506. Bard's Tale won't work!

Newsgroup: comp.sys.atari.st
Date: 1992-01-18 07:02:04 UTC
From: il@bambam.u.washington.edu
Message-ID: <1992Jan18.070204.2850@milton.u.washington.edu>
Source record: 226894

I bought Bard's Tale a few years back. I played it for a while and forgot about it. I recently dug it out and wanted to finish the game. Well, it won't work any more. It keeps telling me there's a disk error when it tries to read the picture disk. I've done a TOS upgrade (to 1.4) since the last time I ran this. Could someone confirm that TOS 1.4 is the reason this won't run on my system? If so, does anyone know of a patch that will allow it run with TOS 1.4?

>background tasks in MiNT).
>
You will use whatever amount of RAM is already installed in your machine as ST RAM. So if you have a 4 MB machine, you will have 4 MB of ST RAM. You should have fast RAM or you will loose close to 50% of the SST`s performance, you can either have 4 or 8 megs.

>Also, how difficult is it to install in a Mega ST? (Give me a soldering iron
>and I can kiss my ST goodbye).
>
Then you should *not* do it, unless you already have a socket installed for your CPU. Installation involves removal of the 68000 - if you do not exactly know what you are doing, you might easily kill the board in the process. You should also have a very good desoldering station.

If in doubt, then have the board installed by an expert!

Please tell us all how this is posible with Standard A500 or is this
the Reason that the Amiga does not have very many DTP programs..??

Also I here that the sales of A500 + is now gone minus, they are all taking
them back as they can't play games on this new machine any more..??

And were are all your PD C compilers, this main Amiga chaps here don't
seem to know much about them..

Also have you thought that we have better things to do with our
machines than to spend time chatting on the net...:-)..

Well don't use Xon/Xoff with compressed files, can only be used with
plain Text files, as the Xon/Xoff codes could be in the data that is
being sent..

Also check out your ACC these can cause problems...

I use Gem SZRZ 1.8 and never get any problems with it at all, but note
not with Uniterm..

>Because it does what it's supposed to do, without mangling files or
>crashing my computer, and because I can use it to exchange files with
>folks who use other platforms.

Actually the port of zoo for the ST is *broken*. So I would use it with
care on the ST until it has been fixed.

Although the cause of the bug isn't yet known at least it seems that having
ctrl-z in some combination can make zoo.ttp bomb with two bombs and thus
leaving the archive broken ... :-(

I discovered this while backing up my harddisk (using my utility dbackup)
and needless to say it was a real pain in the ... because I had to restart the
backup a couple of times before I found that one file which caused it all. :-(

Otherwise I can only recommend zoo because arc has to bad compression ratio
and if you want to use lharc you have x+1 versions comming in every day.

I recently had occasion to check out the (German) implementation of Common Lisp recently posted to A.A.

[some intersting thing deleted...]

Anyone interested in using CL on the ST may well find this implementation of interest.

It won't run under apratt's init.prg under MiNT, but will with gulam. I guess that it's best run from the straight desktop (more memory available), a user-specifiable external editor can be called from inside CL --- this provides a fairly basic, but still functional development environment.

Nice piece of work guys, any chance of an English version?

There is an English version of CLISP, I thought it's already at atari.archive. But if it's not, you can get it via anonymous ftp from ma2s2.mathematik.uni-karlsruhe.de in pub/atari/clisp. There is also an archive of examples, including CLOSETTE (by Xerox) which is an implementation of a (quite big) subset of CLOS. In general CLISP is still a first edition implementation (of Steel, I mean).

The e-mail adress of one of the authors, Bruno Haible, is haible@ma2s2.mathematik.uni-karlsruhe.de.

Cheers,

523. New game on atari.archive

Newsgroup: comp.sys.atari.st
Date: 1992-01-19 00:19:19 UTC
From: cs4gp6am@maccs.dcss.mcmaster.ca
Message-ID: <1992Jan19.001919.15383@maccs.dcss.mcmaster.ca>
Source record: 226758

I've just uploaded a new game I've written to atari.archive.umich.edu
It is called Robugs. The file is robugs.lzh in the atari/games directory.
It's still a beta version of the game but I am interested in hearing
people's opinions of it.

The game is GEM based and runs in low or high res (color or mono). It's
hard to describe but basically what you do is build little robots out
of logic components and set them loose on a playfield. They can be
designed to navigate mazes, attack and kill each other, reproduce and
more. For example you can have two robots battle it out in a dual, or
have entire armies of robots fight a war.

I have released Robugs as freeware. Give it a try and let me know what
you think.

Brad.

524. Terminal emulators and ST-Talk

Newsgroup: comp.sys.atari.st
Date: 1992-01-19 00:33:38 UTC
From: shaffer@durer.phyast.pitt.edu
Message-ID: <201193@unix.cis.pitt.edu>
Source record: 226759

I have recently run into a delema when using my
ST. I have the ST-Talk comm. program but it does not emulate
anything above a vt52 as near as I can tell. I have managed
to find a large source of terminal emulators for the atari
that seem to do better but the X-Modem options on ST-Talk
do not seem to work with binary transfers. That is, when
I transfer .ttp files and try to execute them I get a message
indicating that the image format is not right. Has anyone
had success transfering binaries with ST-Talk? Maybe I need
an update. Any suggestions would be appreciated...including
a hint as to which of the mirad of comm. programs is best.
Please respond via e-mail as I seldom am able to read news.
Thanks...

David Shaffer

In article <OKES.92Jan8220607@solb1.essex.ac.uk> you write:
>Yes, there is now a 386SX emulator (by Vortex, I think)
>
> Simon.

Is it true? Does Vortex have a 386SX emulator? Will it work with my system?
I have a MegaSTe (4) and a SC1435.

I am interested in buying a 386SX (still keeping my precious ATARI).

BUT, if it's true, that there is a 386SX emulator, I can probably save some
money...

I was looking at:
386SX, extended VGA (1024), 2MB mem, memory cache, 40MB to 80MB HD,
3.5 HD DD, 5.25 DD, some telecom, and Windows 3.0 (yeah, I know),
16 or 20 MHZ etc...
All this can be had for around $1350 mail order.

Some questions:
1) Since ATARI is going to be selling kits (ST) to convert to 1.44
meg drives and can read IBM format (?), would this let the 386
emulator read directly from the converted drive?
Or do I have to buy a separate drive (maybe 5.25 or 3.5)?
2) Can I use my present monitor (SC1435) with the extended VGA?
Or do I need to buy one? (though, they are pretty cheap)
3) How is the compatibility (IBM-wise)? Sound? Usage? ETC...?
4) How much will it cost?
If it is going to exceed $1000, I'd rather buy the 386...
(software, hardware (?), monitor, drive) <= emulator

Please respond to me even if they are rumors...

Thanks in advance...

526. Re: Does anyone have any reviews on the Atari SM144 mono monitor?

Newsgroup: comp.sys.atari.st
Date: 1992-01-19 01:19:56 UTC
From: ksommerville@cix.compulink.co.uk
Message-ID: <1992Jan19.011956.27656@demon.co.uk>
Source record: 226766

What was the true story behind the SM125?
I bought one about 1985 and it broke after about 1 year. The repair lasted ab-
out
6 monthswhen it broke in the same fashion - only a thin , central , horizontal-
lin
line. At this poin the commercial guys refused to touch it. The technician at
work got the tech maual from atari and tried to repair it but couldnt. He
knows which chip blows up but cannot find any reason why!
In the mean time I borrowed another SM125, one of the very first and it is
great. i understand the first batch were of good quality, but underpriced, and-
that the second wave re
the second wave cut on quality to make the price.
Anyone know of a cure for these things. Iused to see messages on the NET about-

it a while ago, but nothin lately.

527. Re: Atarians in Japan

Message-ID: <2120@wsdnws.waseda.ac.jp>
Source record: 226760

Sorry, I wasn't perfect. I just wanted to say, there are a number of
software that can display Japanese glyphs (chararcters were more or
less misleading). And as there is no way of writing Japanese letters
on Atari platform, no one uses Atari for BBS, etc. This applies to
the famous IBM PC's as well. You cannot imagine that IBM PC's have
never penetrated into Japan due to lack of Japanese language support.
Only Mac has made it (excepting main frames and workstations). It is
really pathetic that Atarians have to use some other machine when
they communicate over modems. But I have found many people who have
found AtariST very useful. They are mostly either music folks or
Minix guys. AtariST used to be a cheap and fast machine until MSDOS
people began using 386 with address larger than 640K.
I think it quite unacceptable that vendors discontiue their support
for their own products however outdated they may be as long as
customers find them good enough and go on using them.
Long live Atari!!
Tsuji

If sz on the Sparc is anything like sz on SCO Unix, you have to set
the -b flag to force binary. Try sz -h for a list of flags and options.
On the same subject, sx on SCO Unix does x and y modem as well, and
offers a batch flag, but if I set that, it sends something in the header
of the first file that blows up my Y modem batch. Is it trying to do
Y modem G? Anyone know details on sz?

I am looking into buying a used HP DeskJet + printer for use on my
520ST. I know that NeoCept had a program to drive the DeskJet for
WordUp, but in light of NeoCepts death, does anyone have any info on
DeskJet drivers for WordUp, ST Writer Elite, PageStream or other
ST apps?

Sources on soft fonts or font carts would also be appreciated.

Also: I know this question has been on here before, but I'll ask again.
Does anyone know the mods to use a Wico trackball or an Atari CX80
trakball with the ST as a mouse replacement?

Vielen Danken,
andy...

530. Is there a way to convert NeoDesk icons to NewDesk?

>
>I know it won't be in color, I am just wondering whether it can
>run a mono 640x480 mode.
>
I really do not quite understand what you are asking here, so I will give an answer to what I thin I understood: the Spectre will work with any monochrome TT resolution - but not in color modes. It will also work with most monochrome modes of ST graphic boards.

>Does Spectre GCR do the sound via DMA sound on an STe, or is it done
>in software, like on the regular ST?
>
I am not sure, but believe that Dave did not find the time to do any STE specific work on the sound routines.

534. Conversion of pictures to PI3 format

Newsgroup: comp.sys.atari.st
Date: 1992-01-19 16:06:09 UTC
From: silvert@cs.dal.ca
Message-ID: <1992Jan19.160609.5841@cs.dal.ca>
Source record: 226774
Cross-posted to: alt.graphics.pixutils,comp.sys.atari.st

I've been having problems converting PCX and GIF files to PI3 format for importation into programs running on a monochrome Atari ST. I can transform most grayscale images but get incredible graininess in the output using pbmplus (generally ending the pipeline with "... | ppmtopgm | pgmtopbm | pbmtopi3"). I just tried a very simple B&W GIF file with just the two colours (black and white), about 4 kB. It turned into a real mess of snow splattered diagonally across the screen.

If anyone has ideas on how to get usable PI3 images please write or post.

Well for one thing the productivity mode is only available on the new machines with the new 2meg chipset. Older machines still need flicker fixer..
The productivity mode is only a part of the new ECS chipset...

But last I heard this was an Atari echo...
Not only does high res on an st not flicker but it has a faster scan rate which is much better on your eyes..
(Essentially interlace slows your effective scan rate down quite a bit...
And the slower the scan rate the harder on your eyes it is.)

>OK, this seems to ask for an example:
[example deleted]

The key point you're missing is that this whole discussion is about PC-relative addressing. You're not branching relative to a conveniently-placed pointer; you're branching relative to where you are _right_now_, and you might be anywhere within the segment when you decide to branch. Thus, to ensure that you can branch to anywhere else in the segment relative to wherever you may happen to be right now, the segment can only be 32K.

What type of input does the monitor take (never used an ST)?
If it has the composite in (like you'd hook up the switch-box to), just
plug that in.. If it has two RCA in's (Audio/Video), just get a
monitor->RCA jack.. (called a Commidore Monitor Cable in MCM's
catalog..(800) 543 4330

This post partially answers my questions about a 386SX emulator for my MegaSTe.
Is the latest Vortex board (80386SX w/ opt RAM) considered full PC?
What is 'Supercharger'?

Please (anyone) send me information on the Sack and also the Vortex from
Germany (address, telephone, etc) or the specifics on the systems.

Are there any US distributors or are the products strictly from Germany for now?

How much is 800DM in USdollars?

Thanks in advance!

>This is truly a great event in the history of Atari, since the
>Tramiels took over anyway. I believe there was such documentation

Well this is truly a great thing, it is just a little too late!!

There are soo few ST/TT developers left in the USA that I doubt
that the release of the ST/TT Notes will help at this point.

As for me, please read my article in STR804 (due out next Friday)
to see why I won't buy the Atari Devloper Docs pack.

It is said that Atari Corp had to wait until the USA market was effectively
dead to release developer docs which could have had a BIG impact 4
or 5 years again!!

Well, just another example of the poor management at Atari Corp!!

I remember that once, along time ago, Atari used to ship LOGO with the STs. Well, I am now teaching 7th grade Computer Literacy and one of the units that is covered is LOGO. I am looking for a LOGO program, either PD or comercial. Is the version that Atari used to ship now considered PD? If it is, can someone send it to me through email??? Thanks!

>Any ideas?

There should be an option to have TurboAss load bugaboo automatically on
startup somewhere in the 'Settings...' menus (At least there is in my
copy - v1.7.11). Note that keeping both TurboAss and bugaboo in memory
simultaneously is impossible on 512KB ST's and cranky on 1MB's. 2 megs
of memory recommended.

^^^^^^^^^^^^
Not position independant. I think you meant lea mid(pc),a5

| bsr atstart
| rts

|atstart
| ...do stuff here...
| jmp atend-mid(a5)
| ...etc...

|atend
| ...do stuff here...
| jmp atstart-mid(a5)

64K modules use up 4 registers for segment pointers to get fully
position-independant code: stack pointer, frame pointer, data segment
pointer and code segment pointer. With 3 scratch registers, that
leaves the hapless programmer with one address register for local
variables. Less than optimal when the CPU gives you 8 to play with.

And... <shudder> this whole discussion is reminding me of
Intel-architecture memory models. Eeeuuw. ;)

|[...] the label on the bottom of the TT says 8Mb/40Mb.
|[...] However, looking at it with ICD software revealed that it was a
|48.5 meg drive. Why do Atari hide something like that, or is it just -
|a one one off?

I confess!

It's a conspiracy by Atari to steal 8.5 megabytes from you.

You caught us red handed. Boy, it's a good thing those nice ICD people are around, or Atari could have stolen millions of megabytes from TT hard disks all over the world. Darn them, anyhow. That rat Tom Harker is always fouling things up for us by making easy-to-use powerful peripherals. We tried putting him out of business with a bizarre high-capacity hard disk scheme, but he just figured out what BGM meant anyhow.

Now our plot to keep 8.5 megabytes of each ST157N we sell is foiled. Geeze, we can't get away with anything any more, can we?

...ken

p.s. I think if you check again, you'll find that the TTs sold with ST157N 48 meg drives are partitioned 12 megabytes per partition. If not, just use HDX to repartition 'em. The default partition size for the ST157N is 12 meg plus a bit.

Message-ID: <9201192315.aa15112@Bonnie.ics.uci.edu>
Source record: 226796

I've been trying to get Zoo.ttp to work for the last couple of days
and even with the recent postings I can't get it to work.
I've tried the following with both zoo.ttp and the file zooboy.zoo
in the root directory of the a: drive:

After I click on zoo.ttp and the the parameter box I tried:

x zooboy.zoo
x zooboy
x [aA]:[\] zooboy[.zoo]
In other words, I tried both with and without the .zoo extender
on every other option, and I tried both upper and lower case on the
drive option, and with and without the backslash.

The only thing that happens is that it takes me right back to the
GEM desktop.

zooboy is supposed to be a graphical interface for zoo but you need
to be able to use zoo to unzoo Zooboy!!!!! #@&*%$!!

I'd dearly appreciate someone mailing me a way out of this!

Thanx,
Eric Hohnbaum

553. Which are the Roms?

Newsgroup: comp.sys.atari.st
Date: 1992-01-20 07:28:19 UTC
From: ehohnbau@Bonnie.ICS.UCI.EDU
Message-ID: <9201192328.aa15499@Bonnie.ics.uci.edu>
Source record: 226797

I have an old 1040 STf and am looking to buy a set of Tos 1.4
chips, maybe even from someone who is upgrading to 2.06.

I opened up a broken 520 STfm only a year or so younger and
could not positively identify the Rom chip set. I'd been told that
it would either be a 6 or a 2 chip set. I found a 6 chip set under
the power supply, but I can't be positive that those are the roms.

They are the only chips that are obviously a set and also are the only
socketed (not soldered) DIP chips on the board. The only other possibilities
would be two square chips with pins on 4 sides surrounded by some
plug-in casing.

The numbers on the 6 chips are:
(the numbers in [] are the ones that differ from chip to chip)

First line:
C02616[0-5] -001

Second line:
RP23256 015[0-5]

Third Line
6M3 [either 6D A2 or A8]

They are arrayed in 2 rows of 3 diretcly under the power supply

I haven't opened my 1040 but it's likely that it will be the same

Anyone know for sure where the Rom's are?

I'm also looking to buy a set of them, if anyone is looking to sell
or knows a good place to buy.

Thanx,
Eric Hohnbaum

556. Problems with TEC card (TOS 2.06)

Newsgroup: comp.sys.atari.st
Date: 1992-01-20 09:31:37 UTC
From: <>
Message-ID: <1992Jan20.093137.16077@vaxc.aud.auc.dk>
Source record: 226688

A friend of mine recently received the TEC (TOS Extension Card) with
TOS 2.06 from a German Company called Artifex. This got to be the
card that Codehead produces since there's references to Codehead
products inside.

We can't get it to boot the hard disk, a Megafile 30 with AHDI 4.0.
It simply doesn't start. Loading a driver from the floppy works
all right. It is just the DMA boot code which doesn't work.

We have designed our own hard disk (SCSI) interface which works
perfectly with TOS 1.4. This interface BOMBS the ST with the TEC installed!
We get 3/4 bombs (address error/privilege instruction) each time.
Removing the EPROM from our interface and a counter chip gives the
SAME result. Someway or another TOS 2.06 does funny things
with the DMA devices. Anyone out there knows anything about this?
ALL help would be appreciated!!

The trick I use on such occasions when my HD isn't switched on is to open two windows. One with the archive and archiver and the other empty to receive the data. Make the empty drive the active window and so the current directory. Hold down the right hand mouse button and double click with the left button on the archiver. This allows you to start up an application from the non-active window. Specify the exact path, including drive, to the TTP commandline then press return. Some experimentation with RAM disc size may be necessary.

Or use a shell ...

Not being a hardcore gulam user, I might be wrong, but this may be gulams fault. When I tried gulam out (some time ago), I tried to install it from the desktop with some suitable extension. I then had a gulam.g next to the gu.prg and had the same problems as you describe. My guess is that gulam always searches for gulam.g in the current directory (sensible enough) and then fails when it can't find it (not very sensible IMHO). I do think however that if it gets an *.g file as argument, it will load that instead, and thus not fail.

sh.prg could be found in the unix toolkit on a.a. somewhere in the utilities/unix directory. I'm not absolutely certain on the names. I could dig up the exact path if needed.

The unix toolkit is a fairly large collection of the standard unix utilities such as ls, cp, find, grep and many others. Unfortunately it is fairly old, and therefore have problems with UNIXMODE (sh.prg when starting programs) and ARGV (exceeding 125 chars in arguments).

Source record: 226800

```
- It keeps telling me there's a disk error when it tries to read the
- picture disk. I've done a TOS upgrade (to 1.4) since the last
- time I ran this. Could someone confirm that TOS 1.4 is the reason
- this won't run on my system? If so, does anyone know of a patch
- that will allow it run with TOS 1.4?

TOS versions above 1.2 won't run Bard's Tale as is for some reason.
There is a program by Keith Ledbetter called BARDRAM which copies the
first disk into RAM, and runs the program from there. This will allow
you to play it on TOS 1.4. Using the same program, but off a hard
drive, will allow you to run Bard's Tale on TOS 1.4 and up. (TOS 1.6
in the STe won't work with the RAM disk. Not enough RAM.)

560. PageStream upgrades/Deskjet colour drivers

Newsgroup: comp.sys.atari.st
Date: 1992-01-20 10:45:56 UTC
From: jph@minster.york.ac.uk
Message-ID: <695904352.17938@minster.york.ac.uk>
Source record: 226673

Can anyone on the net tell me how to go about upgrading PageStream from version 1.82(UK) to version 2.1 from the UK ? I have written to Soft-Logik and have been eagerly awaiting a reply for about 5 months now and would prefer not to have to phone long distance.

What I really need to know is how much the upgrade costs and what proofs of purchase do I have to return. Has anyone in the UK actually managed to get anything out of SoftLogik ?

On the same track, does anyone know if the new version includes a colour driver for the HP Deskjet 500 Colour ? I am dying to trade in my Deskjet 500 for a colour printer - but only if I can utilise the output from what is still my favourite DTP (on any machine).

Any help appreciated.

Yours hoping that Softlogik can answer all these points and save me from having to buy a PC/Windows 3.x setup to achieve proper colour output.

Jonathan.

Well, I think, you heard about hardware-emulators like vortex-ATonce, AT-Speed,
PC-Speed, Supercharger in almost every constellation.
The most of these stuff has a processor 80C286 on it, but there is also PC-Speed having a
NEC V30-chip on board. Vortex, for example, made a 80C386SX-emulator,
with the highest performance about 15.2 Norton-Index, which is a normal AT performance. And
the best follows: nearly every program runs on that board, it is very easily installed and
also easy in using, for a price about DM 250,-- for a PC-Speed, DM 450,-- (AT-Speed,
ATonce), and about DM 700,-- for a 80C386SX.
ask your local compu-center for more details.

> The latest version for 520/1040 is 1.4. Most Atari dealers ;) should have it
> for about $70. BEST Electronics is one source. You probably have 1.0.
Well, it isn't quiet correct; the latest TOS Release is 2.06 and it's about DM 198,-- , just as the Version 1.04.
But there are osme bugs in 1.04, so you should probably get 2.06 made for STEs.
don't worry, there's a way installing it on an old ST for sure. look out for some platines, your compu-shop should have it already there .....

>existing.

As has been stated by myself and others, converting a program by executing it and generating equivalent code for each opcode encountered is impossible. It is impossible because this process reduces to the Turing Machine Halting Problem, which has been proven to be non computable.

Essentially, you're trying to follow all the execution paths of the program, in order to convert it completely. This is essentially the same as trying to find out if a program will terminate, and hence it reduces to the halting problem.

This is not to say that you can't decide whether _some_ programs terminate, just that it's impossible to do it for _any_ program.

(If you want to know more, I suggest you read the chapter on computation of Roger Penrose's book, "The Emperor's New Mind". It explains Turning machines

for the lay-person extremely well.)

564. scanner software, OCR, IMG manipulation.

Newsgroup: comp.sys.atari.st
Date: 1992-01-20 11:59:38 UTC
From: Trevor.Kirby@newcastle.ac.uk
Message-ID: <1992Jan20.115938.5105@newcastle.ac.uk>
Source record: 226521

I'm debating about buying a scanner and am looking for some recommendations and a few hints for suitable software. I'm intending to use it mainly to scale plans for models and am not looking for mega buck solutions.

What I want is something to scan in plans and allow me to scale them. A CAD-CAM system is way overkill for this, something that allows me to resize an IMG file and either see the size on the screen as I'm doing it or allows me to shrink/expand to a known size will be fine.

I'd also like some software that allows me to glue some images together accurately ie. not like touchup which just gives a blank clip box when you move it round. Has anyone used the golden image scanning tray?

Finally is there any OCR software out there?

> still a first edition implementation (of Steel, I mean).

I have the version currently on a.a which has German messages. I see that there is a clisp-e.arc on the Karlsruhe archive which I am attempting to d/l at the moment. I will sling it up to a.a if/when I manage to get it d/led.

I will also try to get the examples.

566. FTP for PD software

Newsgroup: comp.sys.atari.st
Date: 1992-01-20 12:03:42 UTC
From: J.S.Fothergill@newcastle.ac.uk
Message-ID: <1992Jan20.120342.5586@newcastle.ac.uk>
Source record: 226520

Which FTP sites have PD available for the Atari ST????

BTW in reference to my last mail about a lack of memory, I was right, I've taken it back and now possess a 1040 not a mock 1040!!!

Jane

569. I'd like a CPX to...

Newsgroup: comp.sys.atari.st
Date: 1992-01-20 12:35:30 UTC
From: adrian@robots.ox.ac.uk
Message-ID: <2778@culhua.prg.ox.ac.uk>
Source record: 226655

There are two CPXs I'd like to have. I don't know if these have
been written, and if they're available, as archie searches are
difficult without a filename. If these exist, and are available for
anonymous ftp (or mail server, as our name server isn't working yet so
I can't use Terminator) please tell me.

1. Disk step rate control. I have one 5 1/4" drive and one 3 1/2"
drive, and I'd like to set a 6ms step rate for the 5 1/4".

2. Boot up control. I'm currently using a desk accessory and auto
program called Autoload which loads AUTO programs from a list, so that
they don't have to be in the AUTO folder of drive C. Is there a CPX
based version of the same trick, to save slots?

Thanx, Adrian

I have sucessfully uploaded both files to atari.archive. Interested parties
should look for clisp-e.arc and examples.zoo in ~ftp/atari/languages.

571. Gnustuff updates

Newsgroup: comp.sys.atari.st
Date: 1992-01-20 13:28:14 UTC
From: gjh@hplb.hpl.hp.com
Message-ID: <GJH.92Jan20132814@ghiggins.hpl.hp.com>
Source record: 226667

```
++jrb has released the following GNU s/w update which now appears on
atari.archive in directory ~ftp/atari/gnustuff/tos/updates as "update14.zoo".
++jrb comments:

------------------------------------------------------------------------------
If you use mintlib and not tos lib (or if you use both) then you should be
paying attention to changes in the following library files and merging the
changes into the corresponding files in mintlib yourself, or you may wish to
wait for Eric to release an updated version.

main.c, unlink.c, fread.c, scanf.c (replace with this file), atof.c,
crt0.c, gmon.c, malloc.c, sbrk.c, isatty.c, unistd.h, mkdir.c.

see the Changelog diffs to see what the changes were.

Of course the changes in gemlib, pml, curses, etc are all applicable to both
tos and MiNT users.
------------------------------------------------------------------------------

AFAIK, none of these updates have been applied to the archives in gnustuff/tos

Archive update14.zoo:

Message-ID: <92020.133144GUTEST6@cc1.kuleuven.ac.be>
Source record: 226687

Hi!

I got Sozobon 1.33i `Heat and Serve` from the comp.binaries.atari.st
group, and I installed it on my 1040 Ste with one floppy drive. However,
running the test makefile, it failed on compiling MINICOLR. It gives
a loader error '_main' underfined, which is strange as it is the actual
test nakefile as included in the shipment. Any ideas? Is it actually
a bug in the 1.33i shipment?

Regards,
Kris Van Hees

using jrd's gnu-emacs on a mega2 under a gulam shell we
got the following problems

- It is impossible to enter characters like \ [] {} a.s.o.

- it is not possible to start a shell running as a subprocess.
After setting ESHELL to d:gu.prg (i use gulaem as cli
and set everything like you wrote in readme.jrd
and entering M-x shell i got
symbol's definition is void: get-buffer-process

If anyone knows how to overcome these problems, or where to
get 18.57 for the atari i would be glad to receive your
answer as e-mail.
Thanks in advance

578. Still in search of SCSI tape software

Newsgroup: comp.sys.atari.st
Date: 1992-01-20 14:59:00 UTC
From: jrd@STONY-BROOK.SCRC.SYMBOLICS.COM
Message-ID: <19920120145912.8.JRD@MOA.SCRC.Symbolics.COM>
Source record: 226660

I'm still looking for software to drive a generic SCSI tapedrive through an ICD host adapter. My last query to the net turned up a bunch of responses referencing a TSR and backup application written by Paul Moreau, but alas, none of the people that had a copy were willing to ship it to me, and nobody seems to know where I could get hold of sources for it.

Does anybody have sources for this thing, or anything else that's able to talk to SCSI devices? A related question; is the panarthea archive server still in business? I can't seem to get a response from it recently. Is there another place that archives comp.sources.atari?

As before, please respond via e-mail. Thanks in advance for any software or info.

I have a 9600 dialup connection to a decserver and connect to a sun
at work, and I have a few things I have to do to get zmodem to work.
First I call up and connect to the server, then I connect to the sun.
After I am logged in I go back to the server and set the session to
passall. I go back to the session and then run zmodem like so:
sz -w 2048 filename.ext

It works fine for me.. I get an average throughput of 1100 cps....

Hope this helps???

Oh, the server is a decserver....

John Bunch.

A few years ago Intelligent Music put out an interesting sequencer called "RealTime" that gives you virtually unlimited number of tracks (you run out of tracks when you run out of memory) and lots of unusual and interesting features.

Dr.T's Music software took over distribution of many of Intelligent Music's products (including 'M', the interactive composing tool), and is now offering a closeout on RealTime if you order directly from them. It originally sold for $200+, and now they are selling it for $80. I got a copy, and while I will continue to use KCS Omega as my primary sequencer, RealTime offers some interesting options and variation for those times when I want to experiment or be a little more 'spontaneous' than I can be with KCS.

You can order from Dr.T's directly at (617) 455-1454.

583. Stuck in Knightmare

Newsgroup: comp.sys.atari.st
Date: 1992-01-20 16:15:55 UTC
From: mjb@cs.nott.ac.uk
Message-ID: <1992Jan20.161555.14724@cs.nott.ac.uk>
Source record: 226664

I'm stuck in Knightmare (Bloody obvious from the subject line!!) on the quest for the sword (Quest 3) at the riddle "When is a well not a well?"

I have done the rest of the level its on, and got a gold coin from the jester in the fireball room. Any help anyone???

If anyone needs help from earlier in the game, I can help.

584. 6502 Crossassembler

Newsgroup: comp.sys.atari.st
Date: 1992-01-20 17:17:22 UTC
From: wallmann@zuse.pu.informatik.th-darmstadt.de
Message-ID: <1992Jan20.171722.34659@infoserver.th-darmstadt.de>
Source record: 226675

I uploaded v1.6 of my crossassembler package to a.a.u.e.
A couple of things have changed, so I post a little summary
here for those interested:

- much less bugs now (obviously)

- ANSI-C portable
runs now on the AMIGA as well. (Still runs under UNIX and MSDOS)

- assembles code for Atari 8bit computers, but with a little
conversion program (included), creates files in C64 format and
Apple ProDOS format and also in raw format. (*)

- creates linkable output

- is 98% MAC/65 compatible

- includes linker, librarian, disassembler, MAC/65 detokenizer
ASCII/UNIX/ATASCII conversion program, binary convertor and
segment checker

- produces on the Atari8 bit runtime-relocatable code (one time
relocatable).

It's called nasm16b.zoo/nasm16s.zoo (binary/sources) and resides
in atari/languages/..
It's copyrighted, but free of charge.

Nat!

(*) This has not been actually tested, since I don't have any of
those machines (phew..), but I would be interested if owners
of that machinery have success. It OUGHT to work, since I got
the binary makeup information from various owners of Apple II
and C64.

>
> The only thing that happens is that it takes me right back to the
> GEM desktop.

You didn't mention what model of ST or what version of TOS you're using.
>From your description, I'll bet lunch that the TOS version is < 1.4.
Old TOS converts .TTP arguments to upper case. That won't work with
ZOO. (If you were using a command interpreter shell, such as Gulam or
Mupfel, you would not have a problem.)

I'm mailing you, separately, a copy of ZOOSHELL that is archived with
ARC.TTP. You should be able to extract it using any version of ARC, and
then ZOO should be easy to use.

Message-ID: <cdSkYMu00awY0PLEUE@andrew.cmu.edu>
Source record: 226670

gfarrell@tomato.csil.sfu.ca (Gordon James Farrell) writes:

"...According to the January, 1992 issue of AtariUser, the TT040 will _show_ this spring at CeBIT, but won't actually hit the shelf until 12 to 18 months after that.

Regarding "broadcast graphics resolution", that probably means something like 1024x768, like the supposedly upcoming 24-bit board mentioned in c.s.atari.st.tech (I hope it's true, and also available for a "humble" TT030 :-))."

What to do:

Pick up a copy of the January 1992 issue of _AmigaWorld_. (gasp!)

Read the articles on '040 accelerators for $2500 or so.

Look at the ads for 24-bit, up to 1280x1024 graphics boards, RAM boards with up to 64 Meg, desktop-video boards, and tons and tons of very groovy graphics software.

Also, take a look at a Mac Quadra or an Amiga 3000/25 at your local computer store, which by this point is denying that Atari ever existed.

Weep for the state of Atari product design and marketing.

Flames are expected but not particularly appreciated.

588. Length of MEGAFILE cable

Newsgroup: comp.sys.atari.st
Date: 1992-01-20 18:43:12 UTC
From: nollert@nova.tat.physik.uni-tuebingen.de
Message-ID: <nollert.695932992@nova>
Source record: 226677

Hello everyone,

like almost everybody using a MEGAFILE xx hard disk, I have come to
find the noise level unacceptable. The solution I'm contemplating
right now consists of 'putting it away' somehow: Into a desk drawer,
to the next room, under a pillow, ...
However, the short cable supplied with the MEGAFILE disk makes this
impossible. Are there longer cables available? If I try to make one
myself, what are the potential problems? In particular, what is the
maximum length for this cable (both my manual and the FAQ file are
silent on this point)?

Hoping to receive lots of useful hints before my ears go dead

589. Compressed Backups, Syquest Drives

Newsgroup: comp.sys.atari.st
Date: 1992-01-20 19:29:00 UTC
From: rjg@garfield.cs.mun.ca
Message-ID: <1992Jan20.192900.6188@garfield.cs.mun.ca>
Source record: 226691

I'm looking for a file compression utility for the ST that will create archives across multiple floppies (like ARJ on the PC), or alternately, a PD backup program that does file compression and allows easy recovery of single files. I have a 150 meg hard drive that I want to back up, but not have to use 200 floppies.

Also, has anyone out there used a Syquest cartridge system to transfer files between the ST and a PC? Which controller was used on the PC side? (I have an ICD Advantage+ host adapter on the ST side, so that wouldn't be a problem). Can an appropriately formatted cartridge be used to boot up either system?

Thanks for any hints or pointers.

590. Zmodem

Newsgroup: comp.sys.atari.st
Date: 1992-01-20 20:03:12 UTC
From: psurge@cs.utexas.edu
Message-ID: <knmao0INNct3@grit.cs.utexas.edu>
Source record: 226676

I have been having my problems with Zmodem, but it is in downloading, not uploading like everyone else seems to have. Anyway here is the problem:

When I tell my Unix system to send Zmodem batch, I get the first file fine, but then the program tells me that the sender aborted. When I switch back to the Unix machine, the screen is filled with "^H" all across the screen. Would my machine send those characters and would that be causing the abort to happen?

I am using XYZ in default mode (Zmodem download) and Unix on a Sun.

Please help as I have over 5 megs of stuff to download, and I do not want to wait for Kermit to do all that, and I do not want to have to re-set the down load for each file...

>on the design of the TT memory interface, or perhaps how bad a job did
>they do? I did not mean to denigrate Amigas or glorify Ataris.

i would guess the compilers on the more expensive machines are better.
for example, i get about 100 dhrys/MHz on an ST with Alcyon C and closer
to 200 dhrys/MHz with GNU C. same machine otherwise...

dhrystone is not a very good benchmark, unless all things are equal. that
includes compiler technology in this case. caches on the bigger boxes will
help, as you point out, but few people consider compilers when comparing
(or reporting) dhrystone numbers. i have also seen people posting
executables of dhrystone, which is nonsense.

also realize there are at least 3 versions of dhrystone...

Well, my 3000-25 (nocache noburst) gets 6400 dhrystones, so 6400/25=256
drys/MHz, quite close to the NeXT. That number would be higher if I was using
burst mode and cache on, and not running the term program and text editor.
Just wanted to clarify things...

>
> Is it true that I need sh.ttp to use gnu's make?

yes, and no. simple makefiles will never invoke a subshell, so if you keep it simple, you are fine. gnu make parses each command looking for certain characters. when it finds something (like single quotes, sh commands, etc) it sets a flag to execute that command line via sh rather than directly with what amounts to a Pexec.

>So, where can I find sh.ttp? I haven't been
>able to locate it.

bash or ksh should work in place of sh. you may be able to use tcsh as well, provided SHELL is set correctly and provided your makefile commands are csh rather than sh in construct. note, however, that some versions of make on other platforms (unix) will only support bourne shell (sh) commands. this poses a portability problem. i would recommend against it.

note that i use GNU make 3.60 with some modifications on my system without sh, MiNT, or anything else fancy. it should work with any compiler with a cc-like front end (or even other languages). i use it with GNU C (1.40).

for reference, the O'Reily book on make (Nutshell) is pretty good. i have seen this in regular bookstores. i also find Sun's documentation on make to be excellent. GNU make also has a rather large user's manual, in the goofy texinfo format, if you can find a way to print it. there are DVI versions of the GNU docs, too.

Incidentally, if any new Sozobon users are confused, MAKE.INI may need changes if you are only using floppy drives. I've just installed it to work on the GEM desktop with floppies and found that for successful compilation with MAKE, I had to change the environment paths in MAKE.INI.

Initially they are set to work from C drive. If unchanged, you'll have an error linked to "compiler not found" to a few other messages I've forgotten now. Change the paths for PATH, INCLUDE and LIB to (respectively)

A:\SOZOBON\BIN\
A:\SOZOBON\INCLUDE\
A:\SOZOBON\LIB\

When compiling, I rely on the example .MAK files (which can be edited with a wordprocessor).

Chris.

Mine is not very noisy, but slightly noisier than it was when I first bought
it. I'm thinking that perhaps the fan needs cleaning and oiling, since it
is the main source of noise. Or is it?

601. Repost of my plea for help

Newsgroup: comp.sys.atari.st
Date: 1992-01-21 04:04:08 UTC
From: weiner@terminator.cc.umich.edu
Message-ID: <1992Jan21.040408.9455@terminator.cc.umich.edu>
Source record: 226692

Hi everyone, this is a repost from last week. Fred (our archive
administrator) suggested I repost it, so here it is. Please consider my
request and reply if you feel you can.

Thanks,
weiner

As some of you may know, I'll be graduating this May. When I was
filling out grad school applications, the idea for a recommendation from
the usenet atari community as a whole crossed my mind as something that
would be pretty interesting (especially considering how much time I spend
with doing archive related stuff :)).

With this in mind, please consider writing a brief note, saying
what you think my chances for to complete a graduate degree in
statistics are. I realize this is quite difficult, but there are some
aspects of my work that some of you have certainly had contact with, such
as my organizational skills, my writing ability (Remember the ftp guide, etc.),
my teaching ability (ever try to help someone set up gnu c over email,
a question at a time?), and so on.

Here's how we've set this up to work:

1. You decide you'd like to help me out. You then send a brief
not to Fred Swartz, the archive administrator, who has agreed to accept
letters. His address is archive-admin@archive.umich.edu.

2. Fred will collect them, print them out, and enclose them in the
sealed envelope. I will NOT see these, unless you specifically state
that you'd like me to in your letter.

3. Fred will vouch for the authenticity of the e-mail, and sign all the forms.

That's really about it. Hopefully, admissions committees will look at
this as something original and then with this and everything else admit
me to their graduate program in statistics.

For the record, I'm currently interested in U of Washington, U of
Minnesota, U of North Carolina-Chapel Hill, and Carnegie-Mellon. There
is a number of other schools that I am considering applying to also, but
for now these four are it.

I'd like to thank all of you who reply, it really means a lot to me.

weiner

602. Advice about MiNT

Newsgroup: comp.sys.atari.st
Date: 1992-01-21 04:53:17 UTC
From: n160ao@tamuts.tamu.edu
Message-ID: <7877@tamsun.tamu.edu>
Source record: 226693

I want to delve into MiNT.

What version should I install? Where should I get installation instructions?

What I am hoping that I will gain with MiNT is the ability to do file transfer in the background while I use the computer in the foreground.

What is a good "C" and "C++" to use under MiNT? I have Sozobon and Laser C.

Do any MiNT users use TeX and LaTeX? If so, what version of TeX do you use under MiNT?

Thanks much.
Mark Lehmann

603. Atari ST monitors for sale/wanted; modems & monitors for sale

Newsgroup: comp.sys.atari.st
Date: 1992-01-21 05:29:43 UTC
From: clf3678@ultb.rit.edu
Message-ID: <1992Jan21.052943.22309@ultb.isc.rit.edu>
Source record: 226697
Cross-posted to: comp.sys.atari.st,misc.forsale,misc.forsale.computers,comp.sys.amiga.marketplace

Wanted:

Atari SM124 or SM125 monochrome monitor. Must be in GOOD WORKING
CONDITON. Willing to pay a REASONABLE price for it, or will trade
for it with some of the below equipment (and cash, where applicable).

For sale:

Atari SC1224 color monitor. Analog RGB, can be used on both an Atari ST
and any Amiga (with the proper cable). Manufactured in 1987. Goldstar
variation. Monitor is in PERFECT working condition. Asking $190 or
best offer. I will not sell this monitor until I have obtained an
SM124 or SM125 monochrome monitor. If you've been looking to upgrade
to a color monitor and have a monochrome you might want to involve
in a trade, this may be your chance!

Magnavox RGB Monitor 80. This monitor accepts both digital RGB and
color composite signals, and has a front switch so you can go between
them on the fly. Looks to be about a 13 inch screen. Has sound capability
(RCA jack input). In very good condition. I used this monitor in
composite mode on my Amiga until I got an analog RGB monitor for it. You
can hook up such things as an IBM computer (with CGA card), VCR, Nintendo,
Atari XL/XE and Commodore 64/128. Asking $110 or best offer. Owner's
manual is included so you can make specialty cables for the RGB port.

BMI monochrome monitor. A little old, but works just fine. Green
phosphor display, no sound. Ideal for use on older computers like
the Apple II series (which did not require sound). RCA jack for video
input. $25 or best offer.

Zenith Data Systems 2400 baud modem. Only used a few hours. This is
a "standard" modem, with Hayes compatibility and a size that fits easily
under a telephone. Has the standard 8 LEDs on the front, with power
switch on back. $75 or best offer.

Microcom AX/2400C modem. This is a 2400 baud modem featuring MNP
levels 1-5. Microcom invented MNP, and now you can have a real Microcom
modem! It's been on my BBS for about 3 months, but since I don't run a
BBS anymore, I'd like to sell this modem. It's got lots of dip switches
to set just about everything. Both asynchronous and syncronous operation
with a front switch. There is also a "talk/data" button on the front,
along with 7 LEDs. Owner's manual is included. This modem features
both full Hayes compatibility and Microcom's own protocol. $100 or best
offer.

If interested in anything here, contact me via one of the below methods.

iu> |> can force a Mac to write a disk in Aladin format?

You can force a Mac to write a DOS disk. Threre a 2 programs available to do
this job: Access PC and DOS mounter. A DOS-Disk under DOS mounter behaves just
like a Mac-disk. If it is possible to install one of these programs on aladin,
it should'nt be a problem to excange disk's with a mac.

In Captive, some of the wall sections are mounted on "rollers", and can
be pushed out of the way...

Butre has one such wall section in the "entryway"... check the documentaion
(such as it is) to see how to push a wall section...

Examine the bottom edge of the walls to find the rollers...

BobR

Or you can use the 'novice' command set, which isn't case sensitive. I
believe the command to extract is -extract i.e. type

-extract zooboy

in the parameter box. BTW, I am not particularly impressed with
ZOOBOY. You're better off using a CLI, say, Gulam. (That's only my
opinion, of course. Feel free to disagree.)

To me it seems that V1.33i really only needs the extended object format to be
everything V2.0 is (plus some extras, primarily in speed).

Is this correct, and if so, could we expect somebody to port this too?

611. Re: 386SX emulation (was RE: IBM emulation)

Newsgroup: comp.sys.atari.st
Date: 1992-01-21 10:59:28 UTC
From: gismo@cs.tu-berlin.de
Message-ID: <2152@mailgzrz.tu-berlin.de>
Source record: 226601

well, I'm a user of an AT-Speed(producer: SACK-Electronics) with an C286-Processor on it. Yes, there are no slots available an this board, and there's also no memory on it, but the ST-ram is fully used via XMA memory-access.
the BIOS is able to show MONO-VGA, MONO-EGA, AT&T(640x400) monochrom, and CGA/MGA, at a cpu-speed of 16MHz, which is about a Norton-Index of 8.2. And the most important thing is, almost every software runs.
The support is a little lossy, but the manual make the board easy to install upon your 68000 CPU.

There is a product having the same technical facts(286, 16MHz, 68k-hookup, ST-memory-access,....) from VORTEX, and there is also a board containing a 386sx cpu . this board brings full 386(will mean protected) mode, XMA, EMS is supported, windows runs fully in protected mode, VGA, EGA, AT&T, CGA
and as a option 512k fast-ram on board for full 32bit bus-access.
without fastram there's a NI from about 9.2 to 10.3, having fastram installed, it is 15.2.
And looking at thhe dollar-table, in this moment $1.00 costs about
DM 1.60, it will be about 500 to 600 USDollars.
But, living in germany, I really don't know whether there is a distributor in the United States.

Just ask your local compu-shop, or directly to HEIM-VERLAG, Heidelberger Landstrasse , W-???? Heidelberg, Germany

Sorry, I just don't know the ZIP-code, look it up in a magazine,

The Supercharger is a PC-Clone developed by Bela-Systems, using an own mainboard with own Ram-proms, and it contains about 3 slots for PC-cartridges, as VGA or anything else; you can use both, PC and TRARARI simultanously, and it is connected to your ATARI's DMA port. you may get info contacting to SIEMENS, I think, they got the manufacturing police.

Hope, this helps

612. UNIXMODE

Newsgroup: comp.sys.atari.st
Date: 1992-01-21 11:23:58 UTC
From: thomas@cadlab.cadlab.de
Message-ID: <1833@lutetia.cadlab.de>
Source record: 226589

I wonder why the UNIXMODE isn`t fully supported within the MiNT-libaries of the GCC. Is there any reason for the different behaviour of the MiNT-libaries concerning the UNIXMODE compared to the `standard' libaries of GCC?

One particularly striking disadvantage of this fact for example appears within the usage of the tcsh being linked with the MiNT-libaries:
If you try to apply the `file-name-competion`-feature of tcsh and you have got upper/lower case filenames or filenames longer than 8+3 letters, the tcsh won`t be able to complete these file-names.
Similar problems appear when trying to handle files with programs linked with the MiNT-Libs or for example if you use the tcsh linked with MiNT-Libs and call a program like grep and ls linked with the `standard' libs of GCC:

```
>grep XYZ *.c
file abcdefgh.c not found
>ls
ABCDEFGHIJKLMNOP.c
```

I`d be glad to either know why it is impossible or doesn`t make sense to support the enire UNIXMODE features or if any has a solution to this problem.
Probably it could be a nice idea to use an AUTO-folder-program as a realization of the UNIXMODE so that ordinary TOS executables are also able to share UNIXMODE.

Even if this question may seem strange to you I would like to get an answer.

> Hi - I've been using the TurboAss assembler lately and I'm wondring how to
> get it to load in the debugger (which I assume is bugaboo.prg) to avoid
> to leave the editor every time I want to test something out.
> Any ideas?

You could:

a) load the debugger (bugaboo.prg) before the assembler and let it residently
stay in memory with the command "resident";

b) load the debugger from within the assembler with "Debugger nachladen" from
the "Assembler" menu (make sure that there is enough memory left to load
the debugger (if not, reorganize Turboass' memory menagement by selecting
"Information" from the "Editor" menu and then clicking "Reorganisieren"
(enter the amount of memory you want to keep free (at least 300K) at the
first editable line)).

The names of menus etc. refer to the German version of Turboass; I don't know
if there is an English version, too.

There is a CPX named DISK.CPX. Its source code was published in the German magazine "ST Computer 3/91". I also have got the binary but I really don't know if it is legal to copy it to the net as it is copyrighted by the magazine...

> 2. Boot up control. I'm currently using a desk accessory and auto

> they don't have to be in the AUTO folder of drive C. Is there a CPX
> based version of the same trick, to save slots?

I also use an AUTO program that loads other boot-up's from a list (called Autobatch, written by me ::). If I want to change the setup, I edit the list with an editor; what is the acc/cpx supposed to do?

>language?

Yes it would, but you miss the point that it's the _disassembly_ that's the
hard part! No disassembler can automatically (automagically?) accurately
disassemble object code. How can it know the difference between data and
code? If it attempts to follow the execution path, we're back to the halting
problem again [see previous postings of mine]

With human skill and a disassembler you can get a lot further, but it can
still be very difficult, if not impossible.

What about source? I can't use binaries compiled with dLibs, as they crash under MiNT.I installed 2.0 for a laugh by compiling under the GCC as the "UNIX"-hosted cross-compiler version (GCC on my ST, that is).

Source record: 226607

```
ARCGSH 4.0 (Archiver GEM Shell) for Atari ST
============================================

Arcgsh 4.0, the Archiver GEM Shell for Atari ST, is available now. You can
get it by anonymous FTP from atari.archive.umich.edu; the file name is
arcgsh40.zoo in the /atari/archivers directory. Alternatively you can wait
until it appears in the newsgroups comp.binaries.atari.st.

Arcgsh is a GEM shell that eases the use of the most popular archiving
programs for the Atari ST (arc, lharc, shar, tar, and zoo). Furthermore the
programs compress, uud, and uue are supported.

The most important enhancement with respect to the previous release 3.5 are
as follows:

- The most recent zoo version 2.1 with its `high performance
compression' is supported. By this considerably higher packing rates
can be achieved.

- The archiver tar is supported.

- The compression program compress is supported.

- The lharc interface has been improved considerably. Now Arcgsh can
be configured to work together with any lharc variant.

- In addition to the english manual there is also a german one now.

rjg@garfield.cs.mun.ca (Russell Gladden) writes:

>I'm looking for a file compression utility for the ST that will create
>archives across multiple floppies (like ARJ on the PC), or alternately,
>a PD backup program that does file compression and allows easy recovery
>of single files. I have a 150 meg hard drive that I want to back up,
>but not have to use 200 floppies.

You could try out my program dbackup if you want to. It is specifically
designed to do backups which are compressed using any compression utility such
as zoo or lharc.

Unfourtunately I cannot claim that doing a backup with any of these are quick
but at least it has enabled me to use my old Supra FD-10 10 Mb removable media
when backing up my 150 Mb drive. (<-- I had the same problem as you had...!)

I will be upgrading the program this week I think to be less militant about
127 char command lines (which my program restricted itself to since not all
archivers support the extended command line format).

Also, you probably have to use a shell which does not mess with the command
line excessively. (such as pcommand and desktop capitalising - delimited
options).

Yours,

pao

622. Re: MEGAFILE noise

Newsgroup: comp.sys.atari.st
Date: 1992-01-21 14:31:17 UTC
From: bpat@cs.mcgill.ca
Message-ID: <1992Jan21.143117.20861@cs.mcgill.ca>
Source record: 226626

As with Atari floppy drives, hard drives are quite silent at first, but quickly get noisy. (My floppy can sometimes be heard in the next room). This is because there is some sort of grease on the stepper motor to have it glide nicely. But this wears off rapidly, resulting in many decibels. I don't think there is a way to get around that, as, for the HD, the cord should not (At least, as far as I know !) be any longer then what it is.

(Maybe you should really consider the muffling it with a pillow :-)

That's about the same amount of time it took him to finish. He played
this past weekend, with a total of about 20 hours (realtime) to complete
the game.

Incidentally, he used Hawk as his character.

Regards,

|> Does anyone know whether it is possible to read Hyperformatted
|> disk on a PC. The problem isn't DOS (PC-speed works fine with
|> these disks), so what is the problem?

You're right, it's not a DOS problem. You can even add lines
like "device=driver.sys /d:1 /t:80 /s:11" to your config.sys and
it will work on an emulator on ST's. Maybe up to 10 sectors this
also works on "normal" PC's, but definitely not with 11-sector-disks,
because the standard PC floppy controller is unable to read/write 11
sectors on a DD disk.
And it also doesn't work on a HD-drive, because the data on such
a drive is written in half the physical space than on an DD drive
thus making more space for up to 20 (hyper-ST 21) sektors per track.
You can of cource format a HD disk with 11 sectors, but then it's
only half filled, the other half of the track is empty. Since this
is physically different (allthough it's logically the same) a HD floppy
controller in a PC is definitely not able to read this disk and will
never be, unless you manipulate the controller.

TeSche

P.S. 80 tracks * 2 sides * 21 sectors * 512 Bytes = 1.7 MegBytes
where is DOS with its 1.44 Megs ???????

625. GCC 1.40 & GDB

Newsgroup: comp.sys.atari.st
Date: 1992-01-21 15:28:16 UTC
From: malay@sae.com
Message-ID: <1992Jan21.152816.6418@sae.com>
Source record: 226611

I installed GCC 1.40 and compiled "hello.c" - it compiled and ran fine using Gemini 1.2.1; however, compiling "hello.c" with the "-gg" option to enable use of gdb gave me this:

```
gcc -v -gg hello.c - o hello.ttp

gcc -atariST version 1.40 Patchlevel 2
c:\bin\gcc-cpp.ttp -v -undef -D__GNUC__ -Datarist -Dgem -Dm68k -D__atarist__
-D__gem__ -D__m68k__ hello.c c:/tmp/cc100000.cpp

GNU cpp-atariST version 1.40 Patchlevel 2
c:\bin\gcc-cc1.ttp c:/tmp/cc100000.cpp -quiet -dumpbase hello.c -version
-symout c:/tmp/cc100000.sym -o c:/tmp/cc100000.s

GNU C version 1.40-atariST Patchlevel 2 (68K, MIT syntax) compiled by GNU C
version 1.40.
default target switches:
c:\bin\gcc-as.ttp -v -m68000 -G c:/tmp/cc100000.sym -o hello.c
c:/tmp/cc100000.s

GNU assembler version 1.38
c:\bin\gcc-as.ttp: I don't understand 'G' flag!
c:/tmp/cc100000.sym:0: End-of-File not at end of line
c:/tmp/cc100000.sym:1: Junk character 0
.
.
.
Lots of similar error messages
```

Ok, so whats the problem? Can gcc 1.40 generate the right stuff for gdb? The man page shows "-gg" as the correct option so what gives??

627. VORTEX ATonce 386SX for MSTE's

Newsgroup: comp.sys.atari.st
Date: 1992-01-21 16:41:40 UTC
From: itschere@techfak.uni-bielefeld.de
Message-ID: <1992Jan21.164140.143@unibi.uni-bielefeld.de>
Source record: 226614
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Hi there,

according to the numerous postings about PC emulations on Ataris,
I'd like to tell everybody who's interested some facts about the

VORTEX - ATonce 386SX

It's true that it exists, cause I own one. But it's only for use
with the MEGA-ST/E, since it is plugged in the PLCC socket of the
68000, and all of the other Ataris have DIP CPU's. Perhaps there is
something like an adaptor on the market, but I don't know.

Some facts :

- 32 bit CPU 80C386SX-16MHz
- optional 80C387SX-16 coprocessor
- optional 512Kb fast-ram
- uses internal MSTE-cache
- can use DD and HD floppy drives (theoretically)

Some data :

- Several graphic emulations like
when using a color or monochrome monitor
CGA - 640*200 (2)
320*200 (4)
when using monochrome monitor
HGC - 720*348 (2)
OLI - 640*400 (2)
EGA - 640*350 (2)
VGA - 640*480 (2)
- in the last two resolutions you can only have 640KB of base memory, all
the others can provide 704K base memory
- emulates serial mouse on com1: or com2:
- emulates centronics printer on lpt1:
- every ram above 1 meg is used as extended memory

There may be several thing said, but I'd only like to say a few
important facts. The graphic emulation is of cource the biggest
disadvantage. The EGAmono and Olivetti modes can simply not be
detected. If you try driver=detect in turbo for example, CGA is
reported. But if you ignore this report, it works well. Sadly, most
programs check the hardware before using it, so some programs refuse
to run. The VGAmono solution works correctly as MCGA 640*480 (2) mode
and can be used. Windows 3.0 runs not only in protected (standard) mode,
but also in extended 386 mode including virtual memory and things like

there. The performance is due to the original MSTE-harddisk not so fast, but bearable.

Some performance information:

```
without with FastRam
-----------------------------------
Norton SI4.5 12.3 15.7
PCTools 4.2 330% 510%
```

Now what is FastRam? Well, since the MSTE works as a 8MHz system, but the CPU runs with 16MHZ, it had to be slowed down (waitstates etc.). The Atonce 386SX uses the internal MSTE-cache and is therefore faster than other emulators on ST's. You can buy the additional fastram, which can be fitted in four sockets on the emulator and then completely replaces the lowest 512KBytes of memory, thus making the whole system another bit more faster. I think this is the absolute maximun in emulation performance for ST's that is and will be.

The prices:

Vortex Atonce 386SX : ca. 700 DM = 450 US$

The additinal FastRam needn't be bought at Vortex, since standard chips 4*256Kbit-70ns are used and costs about 50 DM = 30 US$.

The complete ST-ram can be used as extended memory. It is said that you can also configure it as expanded memory and there is a driver included, but this is not LIM4.0 compatible and therefore not widely accepted by programs. It'd like to say that the expanded memory doesn't work, but when using windows for example, that's not necessary.

The whole hardware is emulated quite good. It's funny to see several diagnostic programs reporting all these AT-chips working correctly, and knowing they're not even present.

I'm sorry, but I can't exactly remember the adress, but I've seen it was already posted in the last days, so have a look in magazines or other postings. It goes somehow like this:

```
Vortex
Computersysteme GmbH
Falterstrasse X
D-W 7102 or 7201 or X Flein
```

The W is neccessary for foreign writers, cause since the reunification there are some doubled zip-codes. Forgetting this will not end up in a bit error, but surely delay letters for some more days (and the german post office is really not one of the fastest nowadays).

Anyone who wants to know more or has special questions, is invited to send e-mail to the following adress:

itschere@techfak.uni-bielefeld.de

Hope, this has helped some guys...

No, the NeXT has a bad design. The OS steals too many clock cycles for it's own work (task switching, display postscript, my god man It's UNIX!). We're talking system performance here, not processor performance. obviously an 040 outperforms an 030 at the same clock speed, but because of the NeXT's high overhead it's performance is in the dregs.

Forgot to respond to this item, I would assume he's not using burst mode because he doesn't have burst capable memory in his machine. as for the caches, it depends on what software he's running. alot of crappy german hacks don't work properly with cache's, they "crunch" their code and don't bother to flush the cache's to a update them.

Not that I know of. Make sure that you have the environment set up
properly. Also check minicolr.o to make sure it didn't get truncated
by some mysterious undetected disk write error (nm.ttp is good for
this).

Pretty much. I posted code here last week to modify the 2.0 ld.ttp so that it
and the companion jas from Sozobon 2.0 can be plugged into the 1.33i setup.
Basically what you have to do is fix ld.ttp so that ofile is initialized
and add code in pass1() to search for modules in the LIB directory if they
aren't found in the current directory. (See dlibs.doc, pfindfile.)

024 023 000 0 Waiting 144024 00:00:12 ue M:\_news.tmp
025 024 000 1 Running 28224 00:00:00 PS
```

I just did an escape from my text editor and ran MiNT ps.ttp with the
above result.

Three of the seven processes were compiled with Sozobon C (various
versions) and dLibs: READER, postnews, and ue (MicroEMACS).

You may have had problems with an old version of the library. There were
bugs in the original dLibs 1.2 distribution that bombed programs started
under Gemini/Mupfel and MiNT. As you can see, they were fixed in the
beta-testing stage (which is one reason it took so flipping long).

I can't answer your specific question about source availability, but the
sentiment will be passed along.

Obviously, you meant a 68030 based NeXT.

I must have gotten confused. They don't sell 68030-based NeXT's as far as I know, and the prices for Amigas in Montreal (student prices at University) are ridiculous. So it is quite easy to ass-u-me you would compare your computer to one of the same price range. [As far as I know, people who have access to News are usually working/studying at University and thus are eligible for NeXT's faculty/student prices. Right? Tell me if not.]

The key, though, was _68030 design_. Check.

>I finished Dungeon Master with only one character a couple of years ago.
>It took me about a week, playing 1- 1.5 hours a day. The character I used,
>incidentally, was Elija. What do other netters think of my choice of character

I finished with 1 character somewhere in 1989 I think. I did not have too much trouble since I had already played it with four and the two characters. I used WUUF. Maybe it is just me, but I've never found another character who advanced as quickly in everything... Who said you can't teach an old dog new tricks? (groan...)

When I played with two I used Hissa and Daroou. This is the game I liked the most, the two characters made it more interesting. Plus they were strong enough to wack-a-mole the heck out of everything in sight when their mana ran out. All in all, lots o' fun.

On a sad note, Columbus Ohio just lost their last ST dealer. What a joke. Looks like Atari USA has yet to improve despite the new products (nobody would buy one anyway, at least not around here).

By the way, you really should read my cool .sig file ;-)

That sounds right for Alcyon but pretty strong for GNU. MegaMax is about
1100 - 1600 for GNU seems strong.

>dhrystone is not a very good benchmark, unless all things are equal. that
>includes compiler technology in this case. caches on the bigger boxes will
>help, as you point out, but few people consider compilers when comparing
>(or reporting) dhrystone numbers. i have also seen people posting
>_executables_ of dhrystone, which is nonsense.
Your points are valid (and well understood here) but not very useful. I
think dhrystone is best bench available for general purpose. Much better
than generating primes or clocking nops. Do you *really* think the 3:1
difference is the compiler? I'll still bet most of it is the difference
between 3111 burst and 5 or 6 cycle non-burst or perhaps running ram at
the 'right' speed for the video circuit.

>also realize there are at least 3 versions of dhrystone...
I know of two and prefer version 2.0 over 1.1 since it is harder for
a compiler to recognise and optimize away.

From: be824@cleveland.Freenet.Edu
Message-ID: <1992Jan21.215509.13072@usenet.ins.cwru.edu>
Source record: 226630

Has anybody else out there had any problems saving long strings of
sysex data in Notator? I have never had problems with my sampler and
Sound Designer, but Notator will almost always give me errors, and
it gets all locked up. Any suggestions?
<selick@bucsf.bu.edu>

643. Stuff I need to sell...

Newsgroup: comp.sys.atari.st
Date: 1992-01-21 23:18:50 UTC
From: sap@sactoh0.sac.ca.us
Message-ID: <1992Jan21.231850.20723@sactoh0.sac.ca.us>
Source record: 226637

Here is a list of Games/Programs and that I need to sell due to space limitations in my house. If you are interested in purchasing anything here send me some e-mail at:
sap@sactoh0.sac.ca.us
All games come with their original box and documentation. In most cases everything is in very good condition (i.e. if I shrinkwrapped the box, you would never be able to tell it was used!) The prices below do not take into account shipping charges which I am too poor to pay for and thus you should figure in approximately $2.00 - $3.00 for shipping. In some cases like F-19, which have a lot of docs and thus are heavy, the charge *might* be $4.00. Any and all prices are negotiable, once again just send me some e-mail.
You can request some short descriptions of the games if you are unsure of what you are buying, just send me some e-mail requesting which ones you want to know about.
Hurry, before someone else buys them!

An '*' means I have two(2) copies to sell.

Games	Company	Price
Airball	Microdeal	$ 5.00
AutoDuel	Origin	$ 5.00
Baal	Psyclapse/Psygnosis	$ 5.00
Barbarian	Psygnosis	$ 5.00
Barbarian II	Palace	$ 5.00
Championship Baseball	Gamestar	$ 5.00
Black Cauldron	Sierra	$ 5.00
Boulder Dash Cons. Kit	Epyx	$ 5.00
Dragon Spirit	Tengen	$ 5.00
Dragons of Flame	SSI	$10.00
Dyter 07	reLine	$ 5.00
Elvira	Accolade	$15.00
Escape from Planet of Robot Monsters	Tengen	$ 5.00
*F-19 Stealth Fighter	Microprose	$20.00
Galdregon's Domain	Pandora	$ 5.00
Gauntlet	Mindscape	$ 5.00
Ghouls 'N Ghosts	US Gold	$ 5.00
Gold of the Aztecs, The	US Gold	$ 7.00
Hardball	Accocalde	$ 5.00
Heroes of the Lance	SSI	$ 5.00
Hex Mark of the Unicorn		$ 5.00
Legend of Faerghail	reLine	$ 8.00
Midwinter	Rainbird	$10.00
Oriental Games	MicroStyle	$ 7.00

Pawn, The Magnetic Scrolls $ 5.00
Phantasie SSI $ 5.00
Phantasie II SSI $ 5.00
Phantasie III SSI $ 5.00
Questron SSI $ 5.00
Roadwar 2000 SSI $ 5.00
Rogue Epyx $ 5.00
Shadowgate Mindscape $ 5.00
Shadow of the Beast Psygnosis $ 8.00
TechnoCOP US Gold $ 5.00
UN Squadron US GOld $ 5.00
Universal Military Sim. Rainbird $ 7.00
Zany Golf Electronic Arts $ 5.00

Program	Company	Price
Mi-Term (terminal program)	MichTron	$ 2.00
A-Copier (bit copier)	Megasoft	$ 2.00

Unfortunately, due to several problems in the past(i.e not
receiving payment), I have to ask that you send me the money before
I send the package. If you have a problem with this, please leave
me a message.

Actually, there is a PC shareware program, called Maxi16, that allows you to write up to 1.6 meg on hd 3.5" disks, 1.4 meg on 1.2 meg floppys, 420k on 360k floppies... all numbers rounded... of course, you need to have the program on both computers, and I think it operates as a memory-resident program.

Maybe getting this program would help?

647. How do Cconis() and Crawcin() work together (in MWC)?

Newsgroup: comp.sys.atari.st
Date: 1992-01-22 02:04:10 UTC
From: flinn@cs.ubc.ca
Message-ID: <1992Jan22.020410.13023@cs.ubc.ca>
Source record: 226635
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I need to obtain keystrokes from standard input as they become available, and not have them echoed to standard output. I do not require redirection of input. After some experimentation, it seems that Crawcin() is the best way to obtain keyboard input that potentially needs to be buffered (i.e. I can't guarantee to execute the key press function while the key is actually physically depressed). But I require non blocking input, so I have used Cconis() to determine if a key is actually available. The acual code is:

```
/*
* This function will return -1 if no key is available, or the key
* that was pressed by the user. It is checking stdin, without blocking.
*/

int key_pressed()

{
if ( Cconis() == -1 )
{
return( (int)( Crawcin() & 0xffff ) );
}

return( -1 );
}
```

The problem is that the Cconis() condition does not become true until long after the program starts and many keys have been firmly pressed. After it behaves correctly once, it continues to behave correctly, but the first keystrokes (for which Cconis() did not return -1) are lost.

I'm a novice with this sort of I/O ... am I doing something that is obviously wrong? I am using MWC version 2.1.7.

Thanks in advance,

For sale :

Atari 1040 ST, 2.5 meg RAM upgradable to 4 meg by plugging in more
RAM chips, internal clock/calendar.

Thompson Ultrascan multisync moonitor. This monitor is compatible
with: - IBM CGA, EGA, VGA
- Atari ST high, medium, low resolutions
- Macintosh II
- VCR, video camera etc.
It has separate inputs for Analog, TTL, and composite video.
Three video sources can be connected at once, and then you
can switch between them. Includes a switchbox for the
Atari ST (to switch between monochrome and color), a cable for
CGA/EGA, and a cable for VGA. This is a very nice and
versitile monitor!

I will sell the computter and monitor for $325 EACH. Note that the RAM upgrade
in the ST uses high quality, low power, 70ns RAM. Not the cheap stuff.
If you are interested in either or both, email me or call Doug at
(602)795-7633. Thanks!

Doug Tarico
University of Arizona
I9853100@ccit.arizona.edu

The Champion I took through Dungeon Master alone was Tiggy...

While she starts out with the highest mana of any character, she is also the physically weakest of all the Champions.

The biggest problem I encountered with only one Champion was having her carry all the stuffffff that I knew she'd be needing later on... (food and water were MUCH less of a problem with only one mouth to feed...)

I ended up having her throw all her stuff (mostly in chests) down the stairs to the next level, then going down and wiping out the monsters on that level... then going back to the beginning and trucking all her stuffff to the stairs to the NEXT level, and starting all over again...

It was easier when she finally got to the Skeleton Key stairs... she could easily run up and down between levels to get whatever she needed from higher levels...

Also, she exhausted her mana MUCH faster, being the only one who could cast magic, thus she spent a lot more time resting to regain her mana... it was important to know what areas were safe to sleep in...

> Eric Hohnbaum

It's not the best solution about but what I do is copy the .zoo file to
an IBM disk, put in PC-DITTO and run the IBM version of Zoo 2.1 on the .zoo
file. It's okay if you have the emulator but I thought I'd tell everyone
anyway as the algorithms between machine versions (IBM and ST) appear to
the same for LHARC (but not the PC's LHA), (ARC and PKXARC[?]) and
(UUD and UUDECODE).

It's slow but does the trick.

Chris.

> use of gdb gave me this:

use '-g' and NOT '-gg'. please grab the latest gdb stuff from atari.archive
(atariST gdb v2.6 patchlevel 15) in gnustuff/.../updates/update14.zoo
it fixes a lot of problems with older gdb's. Also, -gg is no longer
supported by either FSF nor is it supported in gcc-atariST and related
tools. ONLY '-g' IS SUPPORTED. (also note that -g and -G are not the same
option to gcc. -G has a completely different meaning).

cheers,

>Oxford, UK. |

This is probably a good time to mention what CPXs are and what they
are used for. CPXs althought thay are compiled as normal programs
are basically treated like subroutines to XCONTROL and as such are not
really programs in their own right.
According to Atari CPXs should do what their name says they do. They
should be used to control aspects of the system. Thus altering colours,
disk drive settings etc are legitimate uses. Controling TSR utilities
such as mouse accelerators is also a legitimate use. Actually running a
mouse accelerator or some other function often performed by DAs is *not*
a good use for a CPX.
Hope this helps somebody out there.

656. Anyone interested in a sound saver for the Roland D70.

Newsgroup: comp.sys.atari.st
Date: 1992-01-22 11:46:31 UTC
From: geert@ccsds.ahold.nl
Message-ID: <3171@ahds.ahold.nl>
Source record: 226646

Hi musicians,

While developing a performance, patch and tone editor for the Roland
D70 synthesizer, I already succeeded a program that receives and saves
the performance, patch,tone and parameters of the D70.
Of course this program can also send the parameters back
to the D70. Now you can edit your patches and tones,
without bothering of loosing (original) patches.
A very helpfull utility, right?

When someone is interested, I will post it to rec.music.synth, or
I will upload the program to atari.archive.umich.edu (if I know
how to do this). Please let me now, if you are interested, or
when you know how to upload programs to a.a.u.e.

Geert.

In principle the DOS Computers are able to read the Atari format, but due to the 'laziness' there are mostly no questions if the disk is not in the 'standard' format. Therefore, even though Atari writes the information to the Bootsector, the DOS comps don't read them, but just assumes it's in the 'standard' format.

ERGO: DOS says NO WAY.......

...But who wants to use DOS Computers anyway ????

>That sounds right for Alcyon but pretty strong for GNU. MegaMax is about
>1100 - 1600 for GNU seems strong.

memory fails, but i remember GNU being at least 1.5x alcyon (both 16-bit). the point about compilers having non-trivial impact on performance is nevertheless valid. i consider 10 percent or more significant so megamax's 35-40 percent improvement is quite significant and points out a possible problem if tests are performed with less than optimal compilers.

>I think dhrystone is best bench available for general purpose.

i could argue that there is really no universally adequate "general purpose" benchmark (real code is _always_ superior), but i won't :-).

>Do you *really* think the 3:1 difference is the compiler?

in this case (ie dhrystones) i can at least point out specific examples where the difference is significant, tho maybe not 3:1 (maybe 2:1). i could probably find 2 compilers on a single machine which differ by 3:1. extrapolation between systems adds more complexity, however. then each system's architectural features and configuration is important if not dominant. and a naive benchmarker could fall into this sort of situation. however, not knowing the conditions under which the reported numbers where generated, i can't claim it is the compiler in whole or in part. i can only tell you that compilers _can_ make huge differences tho. the fact that we are having this exchange indicates the importance of _fully_ documenting test conditions. unfortunately, this sort of info is not easily put in a nice small table so it is rarely done. linpack is one notable exception. jack dongara includes compiler rev as well as all compiler switch settings in his reports. it is sufficient to cite the great importance and relevance of compilers by indicating, at least in the supercomputer market, that the players spend significant development and R&D dollars on compilers, eeking out the last bit of performance possible on unmodified source code. i know of huge deals (ie multimillion $$$) that are won and lost solely based on a few percent improvement in execution exclusively attributed to compilers.

i have also seen as much as 30% or more improvement between compiler revs in the workstation realm (eg HP) so if you are using an old compiler, say a couple of revs old, you can easily see large differences on the same machine and the same benchmark. i'm not sure if this is always true for dhrystone, but it is the case for more complicated benchmarks like SPEC or Perfect Club.

i also know that on whetstone (another common "general purpose" benchmark), a compiler that can inline can make at least a 2:1 difference. since a significant part of whetstone is to measure call overhead, which inlining essentially eliminates, you have to question its value or at least its "proper" use (and reporting). caveat emptor.

Which version of MiNT are you running? There was a hack in at least one version
of MiNT which allows dLibs to work; it was removed in later version of MiNT.
Maybe I got hold of the wrong end of the stick, but I thought all versions
of dLibs misbehaved, because, among other things, they try to recover
information from their parent process (which may well have terminated under
MiNT).

In any case, I'm not using dLibs with Sozobon, I'm using a half-baked port
I did of Eric Smith's MiNTlib, which is why I'd like source. (I _hate_ using
\ in filenames; I have to type them all twice from bash or ksh!)

660. Help atari.archive

Newsgroup: comp.sys.atari.st
Date: 1992-01-22 12:34:20 UTC
From: heszar@skcla.monsanto.com
Message-ID: <1992Jan22.123420.1@skcla.monsanto.com>
Source record: 226580

I have a general question.

I'm new to this system, and I've been reading message
stating that there are files available from atari.archive,
how do I get these files?

I've successfull used ftp, but I don't know the host name
for atari.archive. Or is it part of this system?

Thanks is advance for your help.

664. 1040 st floppy drive problem

Newsgroup: comp.sys.atari.st
Date: 1992-01-22 13:35:44 UTC
From: lloyd@prlhp1.prl.philips.co.uk
Message-ID: <1542@prlhp1.prl.philips.co.uk>
Source record: 226576

Can anyone comment on a problem I have with my Atari 1040 ST floppy drive? I get occasional, random failures, like inability to load a program, and screw-ups

when writing to disc (even something as simple as entering a score into a game score-table). Sometimes there are bombs on the screen.

The problem seems to be associated with the initial activity when accessing a disc. For instance, I can prevent trouble when writing to disc, by first removing the disc, manually rotating the media a little (via the central metal section), and reinserting the disc.

Could it be that the disc position sensing is not working properly? I had the drive checked out on an exerciser, and it looked OK. Certainly, head alignment and rotational speed were well within spec. If there's something (relatively) simple I can try, then please let me know. I'm inclined to think that replacing the drive is probably the quickest solution!

Email responses welcome.

Thanks

Phil Lloyd

>I want to delve into MiNT.
>
>What version should I install? Where should I get installation instructions?

The latest version is 0.93, though I'm not sure if this has made it onto
atari.archive yet. The installation instructions come with it.

>
>What I am hoping that I will gain with MiNT is the ability to do file
>transfer in the background while I use the computer in the foreground.
>
>What is a good "C" and "C++" to use under MiNT? I have Sozobon and Laser C.

The best compiler to use at the moment is GCC, though Dave Gymer is working
on a set of libraries for Sozobon (he's lost half his memory until his SST
arrives from Gadgets.. Necessity is the mother of invention). Laser C is a
bit of a dead loss in this area.

Just a note to let folks know that there is at -least- a problem with one of the example programs that comes with the 1.33i release and STe computers.

I installed the 1.33i release on an STe last night, during the local MAST+ programmers meeting. We then 'tested' the program by clicking on the makefile in the example programs folder. It compiled and ran the test programs without a hitch. However, the 'minicolr' pallette changer doesn't work with STe machines. I didn't go through the code enough to learn whether it was a special call or not; I assume that the program makes assumptions about the color pallette information (which is 4 bits for the STe vs. 3 bits for the ST).

It -did- produce an interesting Moire pattern before locking up though. :)

Wrong and unfair. Compared an outdated machine (NeXT '030) with offerings
from other companies. NeXT ---> ~1000ddrys/MHz.

672. Re: Sozobon 1.33i vs. Sozobon 2.0 (extras)

Newsgroup: comp.sys.atari.st
Date: 1992-01-22 15:23:10 UTC
From: bobhays@spss.com
Message-ID: <1992Jan22.152310.41081@spss.com>
Source record: 226552

On the subject of the Sozobon 1.33i make utility (thanks for bringing it up, Chris:-), I found I needed to uncomment the buffer arguments for use on my box (2 DS/DD drives, a D drive ramdisk).

I commented out the path variables entirely and used the one I defined in my gulam shell as an environment variable. Works fine (I load three executables for Sozobon into the ramdisk at startup and it finds them fine).

I guess I should find a way to pay the "big bucks" for more memory or a hard disk (wonder which is cheaper for an older ST [1040]).

Anyway, if you have problems you might find uncommenting the buffer variables in MAKE.INI will help.

Have fun! - Bob

You are saying that UNIX is such a dog it makes a NeXT run like a '030
Amiga, HP, TT, etc????
The test was on an '030 NeXT.
You are very uninformed. Have you ever used an '040 NeXT? I happen to
own one. I've done benchmarks on it, with and without the window server
running. In both cases with it scores ~1000drys/MHz or ~25000drys.
When tested with the window server running all the other UNIX stuff was
running. Without the window server running it is in single user mode
and is a bit faster. I didn't give exact numbers because I don't have
them in front of me.

The NeXT is in no way a "bad design." Other companies should have a
design so "bad."

This has never happened to me, but a friend of mine was experiencing similar problems.

His solution was to record the sysex at a fast tempo, and then play it back at a slower one. You can also take it to the extreme and use the "half speed" function on your sysex track, if you don't mind it taking longer so send over.

(Btw, you're not sending over entire sample dumps, are you? You're really asking for trouble, in that case.)

676. ST Drive blues

Newsgroup: comp.sys.atari.st
Date: 1992-01-22 16:44:19 UTC
From: aiscc@aifh.ed.ac.uk
Message-ID: <1992Jan22.164419@aifh.ed.ac.uk>
Source record: 226561

I have but a lowly single-sided internal drive, and am desperately in need of an update to double-sided. Can anyone give me any advice as to the best or cheapest way to go about this. Can I simply buy a external drive, or must I fit a new internal. What price an internal, can I fit it myself.

Cheers,

Stuart.

677. Re: GCC 1.40 & GDB

Source record: 226586

```
In article <1992Jan21.152816.6418@sae.com>, malay@sae.com (Bob Malay) says:
>
>I installed GCC 1.40 and compiled "hello.c" - it compiled and ran fine using
>Gemini 1.2.1; however, compiling "hello.c" with the "-gg" option to enable
>use of gdb gave me this:
>
>gcc -v -gg hello.c - o hello.ttp
>
>[...results deleted...]
```

compile it with the "-g"-option. But to run gdb you should do the following
steps:
gcc -c hello.c -o hello.o
gcc hello.o -o hello.ttp
sym-ld $GNULIB/crt0.o hello.o -lgnu -o hello.sym
gdb -e hello.ttp -s hello.sym
(gdb) run
Then you can set breakpoints and start debugging...

From: rogalsky@fraser.sfu.ca
Message-ID: <rogalsky.696100177@fraser.sfu.ca>
Source record: 226562

Hello
Can anybody tell me where I could find

a) printer drivers for Cubase 2.0
b) templates and configurations for Genedit

both on ST of course.

If yu know of an ftp or other site, or have these programs
complete with an assortment of these items and would be willing
to email them to me (they're OK to trade as far as I know),
please drop me a line.

ps. I am looking for Emax templates/configs esp.

thanks
Matt

680. Multifinder for Atari-ST ?

Newsgroup: comp.sys.atari.st
Date: 1992-01-22 17:39:18 UTC
From: maraninx@imag.fr
Message-ID: <29446@imag.imag.fr>
Source record: 226572

I need something like the equivalent of the Macintosh multifinder for Atari ST.
Does it exist ?

Or perhaps someone can find another way of solving my problem :
I would like to use a Lisp interpreter which does not allow to call an editor.
And I don't want to quit the interpreter, then to load the editor, etc...
for each modification of the source.

Thanks in advance

Does anyone have a working copy of this?
I bought one a while ago and I could see all the files and display them as text
on the screen but copying them or trying to use them in Cyber Studio resulted
in disk errors. The guy at the local store checked with the distributor but
the entire batch was foobar. He then sent it back to Antic for me but
that was when they disappeared off the face of the earth.
I located another copy in Toronto last fall but it was foobar, too.

> is it Memorex?

It's probably a bug in VDIFAST.A; not all of the VDI functions have been
extensively tested. It would be great if you could mail me a little program
demonstrating how you called the function (to make sure that we're all
working off the same function description!) I can forward it to the author.

Also, could you post your rewrite that uses vdicall? That way everybody can
use your code while waiting for Ian to fix the GEMFAST bug.

I did a little bit of half-baking on MiNTlib before the ski lifts started
running. (Now my weekends are devoted to an attempt to break some bones
before the snow melts.) MiNTlib isn't the sort of project that you can
work on with 15 minutes here, 30 minutes there, so now I just have a bunch
of untouched files eating up disk space.

I'm just recently found a way to access a.a.u.e, and now I am wondering what things I should get a copy of and what I shouldn't bother with due to memory constraints. I have a 1040fm (1 meg), and a 52 meg hard drive, so space is not a problem, memory is.
I have heard several times that gcc needs 4 megs, so I shouldn't bother with it. I am interested in TeX. Can I run it in 1 meg? Which files do I need?
I have a 9 pin & a 24 pin printer at home. Am I just wasting my time until I get a laser printer?
I would also love to get the ksh that several people have mentioned - so far I have only seen bash.
I am also interested in MiNT - is there any use when I only have 1 meg?
Anyone have a list of 'must-have' utils for the ST? There are so many files and I only have access for 1 term (until end of april) unless I can get another account somewhere else. Is there a good VI for the ST? I have STevie, but it seems somewhat slow (screen updates) even running quickST. I will soon be upgrading to TOS 1.4. I have heard that there are still a few bugs with it. Are there any patches/fixes around, and if so, what are they?

As a side note, what happened to MegaMax? Haven't seen anything from them since my upgrade to Laser C. Did they go belly up and/or drop the ST? Is there a version out there later than 2.0?

Question about the SST. Saw an add in Atari User recently. However, it wasn't clear what the board comes with, if anything. Does it include a 68030? Any memory?

Hope I can finally get some of these longstanding questions answered.

From: tymbrimi@milton.u.washington.edu
Message-ID: <1992Jan22.194723.23878@milton.u.washington.edu>
Source record: 226569

Hi, I recently saw an ad in a friend's computer magazine for a new Supra modem, something like the Supra 2400 PLUS, it says it has asynchronous 300,1200,2400 bps (that's the usual I suppose), 4800 bps with MNP 5, and 9600 bps with v32.bis or v42.bis (can't remember which). So can I actually pay the CHEAP $130 bucks for this modem and dial up my school net at 9600 baud? Sounds like a good deal to me, I know that my school dial-in IS this new v32(42).bis thing, someone tell me, 9600 baud would be awesome for only $130 mail order...

My guess is that the NEC derived controller in the PC can't handle
inter-record gaps as short as they use to get 11 sectors on. The
177x chip used in the ST obviously can. This has bit me before.

Hello there !
I posted the same question month's ago, but i haven't got any answer yet.
So i try again. Does anyone know if it is possible to have an alternate
background on the SM124 with a 'normal' ST ? I saw that feature on the
Mega STE's and the TT.
I know that there's a small program for the Auto folder, which loads any
DEGAS Picture as an alternate background, but only in Low-Res. Now i'm
looking for the same in High-Res. Can anyone help ?

greetings Theo

You're confusing several different Supra modems.

The 2400plus doesn't do V.32. It is a 2400 modem with MNP5 and
V.42/V.42bis, which provide error correction and (potentially) data
compression. Theoretically, V.42bis can provide throughout of up to
9600bps, but in practice the gain from compression is modest, especially
if you're transferring compressed data (ARC, LZH or ZOO files). The
2400plus lists for about $199 and retails for about $130. (This message
comes to you through a 2400plus).

V.32 is a standard that provides a real 9600bps connection; the protocols
that provide error connection and data compression can be piggybacked onto
that. Supra recently announced a V.32 modem and a V.32bis modem (14,400).
The list prices are $349.95 and $399.95 respectively. I think BBS sysops
can buy the V.32 model for about $199 under Supra's sysop program.
Incidentally, the new models also support fax transmissions, but Supra
doesn't have fax software for the ST.

Here are Supra's addresses:

Supra Corp
7101 SW Supra Drv

693. Beginner's FTP Guide

Newsgroup: comp.sys.atari.st
Date: 1992-01-22 23:42:32 UTC
From: weiner@terminator.cc.umich.edu
Message-ID: <1992Jan22.234232.26704@terminator.cc.umich.edu>
Source record: 226600

There's been some talk about ftp lately, so without much further ado.....

This is a basic guide to ftp. It is intended only to get you on your
way to ftp happiness. Please let me know if you have any comments,
questions, or suggestions.

weiner@atari.archive.umich.edu

~~~~~~
Jeff Weiner's FTP Basics Vol.1 #1

Part 1: Logging in
To begin an ftp session, the first thing you need to do is log in to our
machine. You can do this by issuing the 'ftp atari.archive.umich.edu'
command. You should then see something like this:

Connected to atari.archive.umich.edu.
220 atari.archive.umich.edu FTP server (Version 4.169 Wed Jan 2 17:03:56 EST 199
1) ready.
Name (yourhost.domain.edu:yourusername):

At this prompt you'll want to type 'anonymous'. On some hosts, the word
'guest' will work, but 'anonymous' is always a sure bet.

If you don't see this login prompt, but instead get something like
'Our host was unable to trace a name back to (some internet address).
We only accept ftp from properly registered hosts', then you'll have to
ask your sys-admin to properly register your machine in its name servers.
There's nothing we can do on this end, so please don't bother asking.
Also, if your machine doesn't allow you to specify the atari.archive name,
try using out internet address : 141.211.164.8 Then, march down to
your sys-admins office and ask him to install name-service. Your life will
become much easier.

Assuming you recieved the above prompt, you'll then be asked for a
password. Use your mail address. For example, I would use
'weiner@atari.archive.umich.edu'

Part 2: Basic Commands
Once you're logged on, there's a few basic commands you'll want to know about.

ls : lists the names of files of sub-directories in a directory.
ls -C : Lists the files horizontally, instead of vertically.
ls -F : Lists filenames, but adds a / to the end of directory names.
dir : does the same thing as ls, but is needed on some other machines
ls -l : A verbose listing of files. Includes permissions, filesize, etc.
cd : changes directories (i.e. 'cd atari' would put you in the atari area)
~~~~~~

cd .. : Goes 'back up' a directory, to the one you came from.

This from redmond@IUS4.IUS.CS.CMU.EDU:
For more than one argument to ls, use double quotes. Eg. ls "-FC *.lzh"

These are about all you need to get moving around the archive.

Part 3: Getting the Goddies

The main reason you want to ftp in the first place is to quickly transfer files. More often than not, you'll want to transfer the files from the archive to your account. You can do this using the following commands:

First, find the file you want to download.
Second, issue the command 'type binary'. This tells our machine that you'll be transferring a binary file. This is really important. You'll waste a LOT of time if you download files that were not transferred in binary mode.
Third, issue this command 'get <filename.ext>'. This will instruct the archive host to send <filename.ext> to your account.

The last thing you'll want to do is use the 'quit' command. This tells our machine you're no longer interested in ftping files, and would like to go back to your command prompt.

Now, you'll need to download your files from your mainframe(sparc, whatever) to your ST. Usually you'll want to use either kermit or x- or y- or z-modem protocals. They're very reliable. I'd be quite hesitant to try something else. Also, your machine and ST are usually unique to you. This means that I really can't help you with this part. You could try asking, but I'm going to promise anything.

Part 4: A Few Words on Net Ettiquette

Net Ettiquette is something that every net user should be aware of. Relating to ftp, and our archive, it is essentially this:

1) Try to keep ftp usage to an absolute minimum during business hours, in our time zone. That would be 9 am to 5 pm , EST. This roughly means upload or download one file or so and little else during these hours. After 5pm, have a blast. Go nuts. We probably won't mind nearly as much..... Otherwise, we will drive to your campus or place of work (even if you live in Europe) and we'll kick youe butt. Or, Jon will sing Prince songs to you. Whichever you'd like the least.

2) If you have a question about some aspect of ftp service or some other area of your computer, please ask around at your site first. Don't immediately fire off all of your questions to us. I don't mind answering questions about the archive, problems with logging in, or something similar. But I tend to get upset when people ask me questions like, "Jeff, how come I can't get the fgrep command to work properly on my sparc station...."

3) Please try to upload files that you know the archive doesn't have. I know it's not the greatest thing to do, but if you can find time to download stuff, I think you can find time to return the favor and upload things also.

If you have any reasonable questions, any comments or concerns, etc. please mail them to me, weiner@atari.archive.umich.edu.

Thanks,
weiner

News to me. I haven`t even received the first shipment of the standard SST board (for Mega ST and STs with big cases and even bigger power supplies). But then again, in late August 1991 Dave Small told the people at the Atari Fair in Duesseldorf that the SST would probably be shipping within a month.

Gadgets release dates are probably as reliable as those of Atari, but their products have always been worth the waiting time.

You do need version 5.x.x of the ICD utils to work with a TT, and a ICD host adapter...

There are also problems with minicolr that don't have anything to do
with whether it's running on an STe. When run as a prg, my mouse
locks up on exit and I have to reboot. This occurs on both of my
machines, a 520ST/TOS1.2 and 1040ST/TOS1.0. Minicolr seems to work
OK on both machines when it's actually running, though.

>My question is simple : HOW do I kill Chaos? I know it's something about
>fluxcaging/fusing but I have been fighting him for at least 5-10 hours (no,
>not all at once) with no effect. Someone help please, I'm running out of
>food/water...

Having just spent the weekend playing DM at my brother-in-laws, I think I
can help w/ that.. (sound familiar?) Anyway, you can't 'kill' chaos.
If you have the firestaff and that 'rock' (I forget the name of it.. and
so soon!) fused together, then you create a 'cage' using the second option
on the firestaff, and when he enters it, you use the fuse option on the
firestaff.

What I want to know is how to 'continue' after you have Chaos caged? The
hint book said something about 'he might let you gather the treasure after
you're done'?

As a final note, I picked Hawk (the fearless- or is that just plain stupid)
as a solo run because he had the strength to carry some stuff, but had a
little mana as well. It took awhile to build wizard levels- but by the
end of the game, his wizard level was highest (2nd level master- 1st
level fighter).

Oh, another question about DM- I was using the 'better' axe that you
find in the lower levels to hit the stone golems on level 7. However,
I was only doing very little damage to it. Is there something that
works better on these? Once you run out of mana, it's hard to fight, and
if it weren't for that door....

Hey, Ken, this isn't as twisted as it sounds!

When I bought my Mega 2 a couple of years ago, I eventually looked inside and found that it had FOUR megs of RAM in the motherboard!

Apparently very few Megas are like this one. I found that the RAS line to the upper bank had been left unsoldered, so only two megs of RAM were useable. I corrected this oversight, and zam! Four megs!

Atari's attempt to limit *my* address space failed too. Sadly, most mega 2's were not made this way; slim pickings for conspiracy hunters...

... So what's the real story behind the guy with the pipe again?

I believe that the reason behind this is that Megas originally meant to be Mega 4's that had bad memory in the upper 2 megs had this modification made to convert it to a Mega 2. I have an early Mega (Bought Oct 87) which has the original motherboard with room for 4 megs, except half of the RAM chips are missing! Should I ever desire to upgrade to 4 megs, all I need to do is pop in 16 1Mb rams and I've got it. Atari eventually wisened up to this and redesigned the Mega 2 motherboard so that memory upgrades would be more $$$! I believe that somewhere printed on your machine you will find the words "Mega 4" (the bottom label perhaps, or maybe the back) since it was probably intended to be a Mega 4 originally.

--Rob

p.s. To get an idea how old my mega is, it has the 6 chip ROM set in it that almost NO Megas have! Boy am I glad I didn't take Toad Computer's word for it when ordering my TOS 1.4 upgrade!

700. Smalltalk for St

>
>Please tell us all how this is posible with Standard A500 or is this
>the Reason that the Amiga does not have very many DTP programs..??
>
I suppose you don't consider PageStream 2.2 a DTP program??? Don't they even publish it for the toy atari? Of course the Amiga's is one version HIGHER than yours.

The Super Denise chip that is now included with new A500's sold in Europe (and soon to be in the states also) gives Productivity mode which displays 640 X 480 flicker free on ANY VGA type (or multisync monitor). This means a user can go out and buy an $89 paper white mono VGA and use it with his A500. The Super Denise can be had for about $55 for older A500's ($55 + $89 STILL adds up to less than the price of a new toyari monochrome - in case you can't add!)

>Also I here that the sales of A500 + is now gone minus, they are all taking
>them back as they can't play games on this new machine any more..??
>

Kinda like the monstrosity known as the STe??? TOS 1.06 hardly runs anything!! Also, how many of your ST GAMES run on your beloved TT??

>And were are all your PD C compilers, this main Amiga chaps here don't
>seem to know much about them..
>

The amiga doesn't NEED a PD compiler. There are still publishers that support us!!

>Also have you thought that we have better things to do with our
>machines than to spend time chatting on the net...:-)..
>

Since the Amiga is a TRUE multitasking machine, we can do more than one thing at a time. Try THAT with your ST! (and don't even bother mentioning multigem.... That's about as good a multitasker as switcher is on the Mac)

Also I guess keeping an eye out for some loser who will buy your 'computer' keeps the average Atarian pretty busy too!

And MY goddamn pointer never has flickered EITHER!!! In Fact the ONLY non-flickering pointer I've ever seen on a toy atari is when it is running under Spectre! Heh heh heh.....

704. Rom chip set switch time?

Newsgroup: comp.sys.atari.st

Source record: 226598

I've got a 1040 at least 5 years old and I'm pretty sure it has the 6-chip Rom set but I'm not certain and I'd rather not open it up if I don't have to. I'm looking to buy a set of 1.4 chips (used if anyone is wanting to sell) but I need to be sure if mine is the 6 chip set.

Can anyone tell me for sure when the switch was made from the 6 to the 2 chip set? This machine was made before the Mega's came out because my Grandfather gave me this when he got his new Mega not too long after the Mega's came out.

Thanx

705. Re: GCR with overscan?

Newsgroup: comp.sys.atari.st
Date: 1992-01-23 08:38:41 UTC
From: dsmall@well.sf.ca.us
Message-ID: <29570@well.sf.ca.us>
Source record: 226540

// base file has questions about the GCR. //

Spectre GCR 3.0 and below (all versions) do not work with overscan. The problem is that in monochrome overscan, the "border" on the sides of the screen
is created in video RAM, which hacks off Quickdraw, Mac's drawing package. I'm still looking for a fix, but have a few ideas.

We thought we had it fixed once and unfortunately said so.

It does not run in the TT color modes. On the TT, you get ST High Res, or the TT dual-page monitor.

The GCR does sound like a regular ST. It is difficult to adjust the timing of Mac sounds to the DMA sound timing of the STe/TT; the frequency is a little different. Might be worth doing even if the pitch is off, though, since it will greatly offload the CPU.

Happy to answer questions; I have been away from the Net due to SST development for quite some time. You may want to email me at dsmall@well.sf.ca.us as sometimes I don't get here in time before notes scroll off, particularly during "shipping madness".

706. Re: Aladin

Newsgroup: comp.sys.atari.st
Date: 1992-01-23 08:51:26 UTC
From: dsmall@well.sf.ca.us
Message-ID: <29572@well.sf.ca.us>
Source record: 226541

Spectre 3.0 (no prior versions) has the ability to read and write Aladin format disks. Use the Shift-HELP menu to configure the A/B: drives between Aladin/Spectre and 9/10 sectors, if I recall correctly.

To transfer data from Atari disks, use the program TRANSVERTER on the Spectre 3.0 disk. It even does some conversions on ASCII data if you wish; it's handy. It moves data from Atari fd/hd to Mac *single sided* MFS disks (Spectre format only); from there you can write to an Aladin disk.

In all honesty, it is possible that one or another of Aladin formats was not perfectly supported. I believe they had 9 / 10 sectors, single / double sided disks, and another format with MSDOS-TOS data on one side, and Mac data on the other side. Pull up the Shift-HELP menu from inside Spectre (while in Mac mode) and check it out, and experiment.

We added Aladin support as part of the effort to work with customers in Europe who had the Aladin cartridge before the company making it stopped; we did this in 3.0 with foreign language support in menus, etc.

CAUTION: Aladin INFECTS Mac programs with a virus called "Frankie virus" by virus killer programs; only fairly recent Disinfectants and such can find it. This virus checks for the Aladin copy protection "dongle" in the cartridge port. It attempts to disable itself while running on a real Mac; it accidentally disables itself on Spectre, due to pure, dumb luck.

However, any alteration to a program in that manner is not something to be lightly undertaken, and since you said you were moving data around ...

Finally, one other possibility: Boot up an Aladin ST with a terminal program that works, null-modem it to an ST or PC (if PC compatible disks) and x/y/zmodem the files across.

I hope this helps.

-- thanks, Dave / Gadgets

p.s. The author of Aladin is on the net here somewhere ...

707. SST shipdate & Gadgets news

Newsgroup: comp.sys.atari.st
Date: 1992-01-23 09:34:11 UTC
From: dsmall@well.sf.ca.us
Message-ID: <29573@well.sf.ca.us>
Source record: 226545

Here's some updates on the SST, Spectre, MegaTalk, and so forth, for those who aren't on the GEnie / Compuserve networks (was posted there this week).

We expect to start shipping SST's this week, barring Murphy's law causing some minor problem. The software, hardware, and manuals are ready, as well as a lot of mailing labels ... :-)

We're sorry for the delay in shipping. It was vital to track down a serious bug in the hard disk "life support" for hard disks that were SST RAM (fastram) unaware; it turned out to be a buffer overlaying code. But it took weeks to nail down and led me down many false paths. Fun.

Several people have asked about the manual. Currently it is 2.8 megabytes long in Quark X*Press on Sandy's Mac. It works out to around 140 pages, plus or minus a few, on 8 1/2 x 11 paper. It's our best ever, with plenty of interludes.

MegaTalk was held up on its production run by having one PAL on every board be bad, probably from the factory. (SST had 4 bad GAL's from the factory -- what's this Built in America stuff? Sheesh, talk about getting good at switching chips). The MegaTalk batch here is about 75% tested, and once you replace the PAL controlling serial I/O, they work fine. They'll ship as soon as we get the SST shipping smoothly; both are backlogged "to the gills" <-- Americanism.

Spectre is still at 3.0. Work is being done now on TT SCSI hard disks so the internal drive and other SCSI devices can be accessed; that'll take a little doing but isn't the end of the world. The code to fix the cached accelerator bug on <4 meg machines is very minor (10 minutes?). Finally, System 7 is giving me absolute conniption fits as I trace it, with the ZAX set to "twang" and stop on any access to location 0 (typical Zerostore goblins);
I don't understand why any sane programmer would read the entire contents of battery-backed up extended parameter RAM into location 0 on up, thus destroying all the 68000 exception vectors.

I'll fix that one, and keep on slogging through until the thing boots up and quits hallucinating about its available memory (current symptom). Problem is, I have NO WAY to predict how many bugs lie between where I am now and bootup time; I just have to fix one and let it "G"o, and see where it crashes NeXT ... *grin*. It's like debugging anything else, I guess.

This means, in simple terms, Spectre 3.1 does not exist.

Anyone advertising it? I have heard rumours. It just plain does not exist.

It's been an interesting few weeks, as you might imagine, and
I've seen plenty of Colorado sunrises since I can get work done at night.
I have not been on the Net as much as I would like, nor any network; I have
had to focus time on SST's hard disk snag, as that was holding up the
manual and the disks, and it turned out to be difficult. (ST-Report ran the
final story; it's around 450 lines of text.)

I'll try to be answering back e-mail over the next few days; I still
have a couple minor "clean up" things to do (READ.ME files on the release
disks, for instance.). Currently, SST is at version 1.21.

We will begin the sixth Gadgets Newsletter as soon as I have something
to report on 3.1. I believe we are planning on FREE distribution of 3.1
unless something comes up to snag it (I can remember someone claiming that
posting s/w to the nets made it "public domain" ... yeah, right). I don't
know if the size, around 400K, will overload the net; I can't FTP and never
have, and don't know that side of things whatsoever. Maybe someone can let me
in on it. I'd like to get 3.1 around as quickly as possible.

Finally, we have isolated several different problems that TT's can
have with GCR's. Briefly, they are:

* The floppies are getting EMI from the monitor -- move it.

* The cartridge port fuse, on the +5 line, is blown. Common.
Check pins 14 and 28 for 0 and +5 volts (or close) respectively.

* The floppy drives may not be 100% if you have the caches on.
A lot depends on how fast the 68030 runs, which can depend on if
the program ends up paragraph aligned at a critical point. (True!)
Try clicking the caches off from the Spectre menu.

* DO NOT TT-RAM flag SPECTRE.PRG, LAUNCH.PRG, or GCRTEST.PRG.

* Finally, there can be a timing bug that relates to 68030's in
general and the GCR. It really all depends on the particular TT and on a
particular chip's speed in the GCR; if your GCR works, don't fix it!!!

We have a fix for this timing snag that appears to cure this problem
after much testing. I will try to get it from GEnie and upload it here. It
involves adding one IC piggyback and an RC network for fine tuning.

In the USA a "fix" involving piggybacking 7406 chips was published
by Atari User; no one checked with us. We have no idea why this would affect
the GCR on the TT whatsoever, and have talked to people who have gone to the
trouble of making the change to find it makes no difference. HONEST, the 7406
is NOT IN THE PATH OF THE MAC DATA being made by the GCR and sent to the disk;
the GCR drives the write-data line directly! I do not understand what this
7406 fix is about.

We have built up several hundred modified GCR's for TT's (they also
work on ST's still!) and are getting them into the pipeline.

Sorry for the overly long note; I had to route MANY rumours to
/dev/rumour/null.

Dear Hans-Peter

Some years ago ATARI tried to fulfill this wish, but soon the cut the cables again. As the stated, only those shot cables give you a secure operation. LOts of people reported problems with longer cables, so if you don't have a bufferd HD-controller, you are restricted to the ATARI cables.

Sorry for the bad news
Ewald

Well, in fact you must simply replace the internal drive by any double-
sided drive with shugart-bus connector and that's all... except that the
front plate layout will not fit in an ST, so you'll have to modify the
case a bit.

The costs of this operation?
Approximately 120DM = 75 US$ = 45 GB pounds
(just for the dd-drive without any case or power supply)

But be sure to put the connectors in the right way to it, otherwise...

Dear Billy
In the case I misunderstood your message, I excuse me in before, but
'the stuff' you 'record via MIDI' is coded data for KEY-PRESS, KEY-RELEASE,
... (all events related to your special keboard). If you write an interpreter for
those datas, sample the souns of your instruments ... then you can play the
MIDI-data on an STE.

Greetings from Munich
Ewald

No the prices are listed at $299 or $399, the lower price is for the V32
model, and the other for the V32bis...

I don't really want to get involved in an Atari/Amiga flame war, but I heard
something about the Amiga from a friend who just got one, that I thought was
so funny, I just had to share it with my fellow Atarians.

You know how the Amiga fanatics flaunt the fact that they have a TRUE
multitasking machine. Well, apparently when two processes decide to
access the floppy, they do just that, and the head runs up and down the
disk as each moves it back and forward never getting where they want.
Eventually (after several seconds) they time out and after a pause one
restarts first and manages to complete the operation.

Can you say elavator algorithm ?, the Amiga systems programmers did n't.
(I think the machine by friend bought was new, so this is the current
release of the OS :-)

A note to all Atari owners on the net - please don't reply to the Amiga idiot who insists on trying to start a flame war every other week. These flames are totally non-productive and a complete waste of time. If we just ignore him he'll get bored and go off to somewhere else and leave us in peace.

Maybe we should have a moderator to filter out this flame trash.

I believe that you can just go out and buy a slimline 3.5" drive mechanism
and plug it into the ST. You will probably have to cut your ST's case so
that you can push the button that ejects disks.

This is essentially what you get with "1MB drive upgrade kits." -- the
mechanism and instructions on where to cut your case! You will probably save
money by buying a 3.5" mechanism directly.

Dear Theo

The best you can do, is to buy QuickST 2.x (or higher). With this util you get
faster screen-output and you can either have a (user-defined) pattern in the
background or a DEGAS-picture.

718. TT Fast-RAM for sale

Newsgroup: comp.sys.atari.st
Date: 1992-01-23 13:11:23 UTC
From: andre@cix.compulink.co.uk
Message-ID: <1992Jan23.131123.10072@demon.co.uk>
Source record: 226531

Sorry if this is in the wrong place; I'll keep it short.

I'm upgrading my TT to >8Mb, but to do so my existing 4Mb Atari Fast-RAM board (about 6 months old) has got to be unplugged. If anyone wants it, it's yours for 350 UK pounds (about $620), or nearest sensible offer. It's a simple plug-in unit which would take a standard 2Mb TT up to 6Mb - the board is small & light, so could easily be air-mailed to anywhere in the world.

Any takers?

>Also, how many of your ST GAMES run on your beloved TT??

How many games will run on the A3000? I suspect none which assume that the processor is a 68000 or which assume that the hardware is theirs alone to play with. If they don't run, it's the software authors who should be blamed, not the hardware.

>
>>And were are all your PD C compilers, this main Amiga chaps here don't

>multigem.... That's about as good a multitasker as switcher is on the Mac)

Have a look at the MiNT project... it is a fully multi-tasking OS extention
for TOS and includes such things as PIPEs, SEMAPHORES priority scheduling
etc, and the source is available! (It will run ALL software which doesn't
assume too much about the system, eg that it loads at a certain address or
that it knows where its parent's data space is).

If you want a Real-Time multitasking OS, then get RTX.

And.. oh yes.. multi-TOS is just around the corner.

>
>Also I guess keeping an eye out for some loser who will buy your 'computer'
>keeps the average Atarian pretty busy too!

This is again childish.

>
>And MY goddamn pointer never has flickered EITHER!!! In Fact the ONLY
>non-flickering pointer I've ever seen on a toy atari is when it is running
>under Spectre! Heh heh heh.....

Erm.. the pointer on my machines has never flickered! Maybe you were
thinking of the Amiga pointer on a HAM mode screen. (Sorry.. that's childish
too.)

Steve

PS. The Amiga is a fine machine for graphics, and quite good for sound, but
it isn't ideal for some things, including I must say, programming in C.

>And I don't want to quit the interpreter, then to load the editor, etc...
>for each modification of the source.

I had a similar problem with a version of prolog. I got round it using MiNT;
suspending prolog whilst I edited, and suspending the editor whilst I, er,
prologed. You could also use the MGR window system under MiNT (but this
really is the long way round - nice if you can, though). This does seem
like an awful lot of trouble to go to, thought, if you don't already have
MiNT. Perhaps you should try looking for another Lisp? (Any Lisp guru's
out there know hidden system()-type commands in Lisp?)

There is a freeware software syntesizer called SMS from R.A.P. It's able to record MIDI events and to pump them to the audio outputs (mono and STe's stereo (I think; I don't own a STe)) with a reasonable quality. It supports four sound channels and two drum channels.
Is that what you need?

SMS comes with lots of samples and a tool that lets you create your own high quality samples. For 40DM you get a tool that lets you play SMS soundtracks from within your own programs.

To get an impression of SMS' quality, get one of the games MidiMaze II (shareware) or OXYD (dongleware): The title soundtrack of these games was created using SMS.

Oh, I forgot: SMS' docs are in German. I don't know if there is an English version.

Message-ID: <1992Jan23.145728.4683@acsu.buffalo.edu>
Source record: 226515

My apologies on the meta-discussion. (Anyone who has read news.announce.newusers can tell you that meta-discussions are frowned upon.)

However, does it really matter which computer is "better"?

More importantly, who cares?

"Knowing" that you have the "better" computer doesn't change its capacities, in any case.

Most of the flame wars I've witnessed are a result of ignorance. Cheap shots and ad hominem attacks are not going to change this.

I suppose its an ego thing to think that the computer you own is the "best". (I'm not necessarily above this myself.) So if you're going to waste your time arguing in ignorance using cheap tactics, will you please take it into e-mail?

All flames will be blissfully ignored.
Please note the follow-up.

727. Desk Accessory ordering -- Summary

Newsgroup: comp.sys.atari.st
Date: 1992-01-23 15:43:58 UTC
From: mjl-b@minster.york.ac.uk
Message-ID: <696181437.10821@minster.york.ac.uk>
Source record: 226528

Thanks to all those who responded to my question about how desk accessories are ordered on the "Desk" menu -- a summary follows:

When starting up, the AES gets the name of the next accessory (using Fsfirst and Fsnext GEMDOS calls), loads it and executes it. As soon as the DA makes an AES call, the AES suspends execution of that DA and loads the next... and so on.

The ordering on the menu depends on the order in which the DAs execute the menu_register call. However, due to the behaviour of the AES described above, "Desk" menu ordering depends on how many AES calls each accessory makes before it calls menu_register.

If all the accessories make the same number of AES calls, then the ordering will be the same as directory order. Otherwise, it depends on the number of AES calls made by each accessory.

A program was posted to comp.binaries.atari.st a while back (volume 11). It was sent/written by Noud van Kruysbergen. You can obtain a copy from the atari.archive server in the /atari/Binaries/volume11/desktop1 directory. There are 2 uuencoded parts to the program.

The program only works with monochrome monitors.

>>

I have a somewhat related question concerning my Supra 2400 modem.
I have been using it satisfactorily for several years until recently
new modems were installed on the server here at the university.
Now I cannot connect at 2400 baud (tho' it does still work at 1200).

According to the docs, the dial-in lines use V.42bis at 2400 baud.
My Supra 2400 manual says it is V.22bis. Is there an inherent
incompatibility here? Do I need to get a new modem using V.42bis
to talk at 2400? Please say no! I know nil about what V.42, V.22 etc
means so be easy on me.

thanks for any help.

733. PRGFLAGS review (was talk about Tcsh)

Newsgroup: comp.sys.atari.st
Date: 1992-01-23 18:54:00 UTC
From: apratt@atari.uucp
Message-ID: <1992Jan23.185400.15899@atari.uucp>
Source record: 226454

This is a review of what PRGFLAGS means; some people don't know and
are asking.

Starting with TOS 1.4, a previously-undefined field of the program header
(the first 0x1c bytes of every program file) acquired a meaning. It's
called PRGFLAGS, and contains bits and numeric fields which control
various things about the program.

The fast-load bit is Bit 0 in the PRGFLAGS field. Normally it is clear.
When it's clear, or if your TOS is older than 1.4, then all the memory the
process starts out with is cleared before the process is started. This
includes the BSS space that the program declared, and also the "heap" space
between the end of the BSS and the top of the memory the process gets.
Clearing this memory takes time, especially on a 4MB 68000 machine. If you
set the "fast-load" bit, TOS 1.4 and newer will save time by not bothering
to clear the "heap" memory. It still clears the BSS -- the BSS is
guaranteed to be clear when your program starts up.

Nobody ever guaranteed that the "heap" would be clear, but the original
GEMDOS cleared it, and some programs rely on this, either on purpose (i.e.
the programmer knew it would be clear and was counting on it) or by
accident (the program has a bug in which, for example, an uninitialized
field of a structure obtained from malloc() is expected to be zero). Thus,
for compatibility, the default action is to go on clearing this memory, and
if you ask for it (by setting that bit) the memory won't be cleared, and
the program will start faster.

Bits 1 and 2 of PRGFLAGS are concerned with the eligibility of alternative
RAM for loading the program and for satisfying Malloc calls, respectively.
The concept of alternative RAM comes into play if there is memory in
your machine which is not like ST RAM. This is the case in TT's and
in some 68030 accelerator systems. Also, bits 28-31 encode a four-bit
number which is also used when deciding whether to load the program
in alternative RAM.

All other bits in the PRGFLAGS field of the program header are reserved for
use by Atari, and should be set to zero unless you know what you're doing.

There is a program from Atari called PRGFLAGS which lets you examine and
set the flags in the headers of your program files. Check for it on
atari.archive, local archive servers, or the Atari roundtable on GEnie.

> to talk at 2400? Please say no! I know nil about what V.42, V.22 etc
> means so be easy on me.

No, there isn't an inherent incompatibility. All standard modems that
support 2400bps connections do it with V.22bis.

Does your university's modem support 9600 (V.32) connections? If so, your
old-model SupraModem may be ``falling back'' to 1200 about the time the
university modem is falling back to 2400, so they never link up at the
higher speed. Check your modem manual to see if there's a way to disable
fallback (connect ONLY at 2400) or extend the time your modem waits for a
2400 connection.

The V.42 stuff takes place AFTER the basic connection has been made. If
your university's modems work properly, they'll notice that they get no
V.42 answers from your older SupraModem, and proceed with a conventional
2400 link.

V.42 and V.42bis do not have anything to do with the speed of the link.
They deal with error-correction and data compression. They DO affect the
amount of data that will flow (computer-to-computer speed), but not the
speed at which signalling events take place (modem-to-modem speed).

V.42 is LAPM (Link Access Procedure M) error-correction. This is a
standard that describes the way two modems can detect errors and
retransmit bad data without either computer knowing anything about it.
They use a block-checksum method, sort of like Xmodem in a general sense.

V.42bis is BLTZ (British Telecom Lempel-Ziv) data compression. The modem
analyzes outgoing data, compresses it, and then hands it to V.42 for
transmission. The receiving modem then decompresses the data. It's sort of
like running ARC, ZOO or LZH on the fly. On easily compressed data, the
actual throughput might be three times as high as the bps rate supported
by the two modems. (Obviously, the computer-to-modem connection has to be
set at a higher speed. This requires flow control, which is a complicated

subject on the ST due to bugs in various versions of TOS.)

V.42 and V.42bis can be run on top of any modem-to-modem link speed.
The SupraModem 2400plus runs those protocols on top of V.22bis. High-speed
modems run V.42/V.42bis on top of V.32 or V.32bis links, achieving very
high throughput.

Since we're on the subject of Dungeon Master, I'm playing it again for the second time. I had read somewhere that if you 'throw' the firestaff out of the room from where you first got it, rather than walking out with it, then the upper levels will not be closed up to you. I can't remember where I read this. I'm only on level 5 now, but could someone substantiate this information about the firestaff? I would love to be able to walk back through the dungeon with a firestaff and show those purple worms on level 4 a thing or two!

Message-ID: <1992Jan23.204707.29462@mnemosyne.cs.du.edu>
Source record: 226529

I just got Z*Net yesterday, and it says that the PBS show The Computer Chronicles will be at the NAMM show, and will focus on Atari in the MIDI field. Issue #91-03 was dated Jan. 17, and they said that the NAMM show started on Saturday. Z*Net also said the show is watched by about 700,000 viewers. You may want to make a point of watching The Computer Chronicles to see the show. I don't know how much of a delay they have in when they film and when they actually show it, but I would assume it is pretty quick since the computer industry moves so fast. It is on Wednesdays at 11:30am, and the Wednesday shows are repeated Sundays at 3:30pm. You should probably make a point of watching this Sunday's show to catch it.

Check your local TV listings for the right channel. For those of us in Colorado, it is on Channel 12.

Um, I think perhaps they are referring to optimal throughput with compression.
Thus, you could conceivably get 9600 baud every once in awhile (when you
just happen to be modeming something that can be compressed 4-1), but the
modem will not operate at that speed all the time. I have found that
even at true 9600 baud (32000 baud optimal), the overhead introduced by
the MNP error checking just about cancels out any speed advantage from
data compression.

>

Although I might be totally wrong here, I suspect (guess) the problem
is that there is a call to wind_update(END_UPDATE) missing from the source
code... Take a look at the code and make sure that for every call to
wind_update(BEG_UPDATE) there's a corresponding call to
wind_update(END_UPDATE).
However, if the code contains #ifdef directives the above search may turn
out to be rather tedious, 'cause you have to make sure that every pair of
calls to wind_update() lies (sp?) in the same context.

Note that I haven't looked at the code of the program so I am just
suggesting a possible cause of the problem.

>
>I need something like the equivalent of the Macintosh multifinder for Atari ST.
>Does it exist ?

There is an application called Revolver which can give you multiple ST's
that you can select with hot-keys. For example, you can split a 4 meg ST
into 4 1040ST's (functionally at least), and switch back and forth between
them. In your case, you would probably (given 4 megs) use 3.5 megs for LISP
and 512k for your editor.

>
>Or perhaps someone can find another way of solving my problem :
>I would like to use a Lisp interpreter which does not allow to call an editor.
>And I don't want to quit the interpreter, then to load the editor, etc...
>for each modification of the source.

If it is a GEM application you might try using an accessory editor, like
STENO.

751. Amiga geeks, read this

Newsgroup: comp.sys.atari.st
Date: 1992-01-24 00:02:00 UTC
From: Azog-Thoth@cup.portal.com
Message-ID: <53265@cup.portal.com>
Source record: 226453

If you are an Atari ST user, and have no desire to move to an Amiga quit out of this.

If you are an Amiga user who insists on posting derogatory article GET THE FUCK OUT OF HERE. Notice the name of this news group? It is "comp.sys.ATARI.st". That ATARI means ATARI, not AMIGA. Go play in your own amiga land.

There is one asshole: Gregory Miller england@milton.u.washington.edu, who seems to feel the need to bash the Atari. Maybe he has his own feelings of insecurity?

Once again, GET THE HELL OUT OF HERE. Go kill yourself, get a life, die, we wont miss you. Post on your own goddamned newsgroups about how bad Atari is. I dont read any Amiga newsgroups, nor do I post there either. But if Greg Miller presists on this childish behaviour, I can post a few flames myself. But I dont want to do that. I like to consider myself above such jerkoff actions. You dont like the Atari, get the fuck away, and shut the hell up, yes?

I dont like computer wars, and I am sure there are others who feel the same, but if youll notice, many Atari VS Amiga wars in comp.sys.atari.st are started by AMIGA GEEKS!

In a thread some bit back, titled Atarians, where are you. I posted that I would consider an Amiga as a computer (I dont own just one, I own at least 20 different kinds, and the Amiga would be just another collection), but I do not want myself linked to people of such low mentality. Do I judge too hashly? I dunno, but out of 10 Amiga users I met, they all act the same. Its like a fucking brain virus.

Enough said. Flames, comments, etc, to /dev/null. If you (an Amiga user) reads this, and gets mad and wishes to flame me, dont bother)

Billy D'Augustine
Azog-Thoth@cup.portal.com

PS: To Greg Miller: I own a brand new 520STe, with 4mb of RAM, and TOS 1.62, and Ive yet to come across a program that wont run on it. I cannot play some games, simply because I do not have a colour monitor. And dont bother starting stupid wars about the different monitors. Your an asshole

Get the file "ibmdrive.lzh" from atari.archive.umich.edu. It will tell you
all you want to know about ST drives.

Buy a Teac mechanism. They do not seem to have the media change detection
problem that other mechs sometimes have with ST's.

Feel free to email if you get stuck.

Can you tell me what the problem was , as these machines can take both,
the 2 chip set is far better as it has less buss loading..

The only problem could be with very old ST's and ones with 2 rom sockets
as they can only take this 2 chip set, with out adding the extra sockets..

Well I quoted negative sales, meaning that they are taking there A500 Plus
back to the shops as they don't play games any more.

One shop here stated to me that only 2 games in the shop would work on
the New A500 +.

The games that are packed with the machine, most don't work, Commodore
include a list with the machine of the games that don't work..

And even Lemmings does not work, is that a old game..??

All this has been confirmed by 2 other Amiga Shops here

Hey this new work bench that they have still can't lasso files, to
copy or delete..

And they still use Sum Checks on all there disks..!!

> james
>

Well it should not be this way, V42 is a error correcting protocal
and V42 bis is a compression Protocal, you have a option to turn them off/on,
they are not part of the line standard, that is your V22,
if the don't let you connect then I would say that the system has been
programed incorrectly..

Check to see if there new modems support that line standard V22...

Good idea, Bill, but perhaps a better one would be the more general
comp.sys.atari.st.emulation, encompassing both Mac and MS-DOS support.

I was just reading an add in the ST Informer about MultiGem which claims to be just like a multifinder for the ST. Having never used MultiGem or Multifinder could someone else shed some light on this subject?

Thanx

Terry

>Eventually (after several seconds) they time out and after a pause one
>restarts first and manages to complete the operation.

This part is wrong. The head walks back and forth between the areas
of the disk where the accessed data is. The difference on the Amiga is,
AmigaDOS (actually trackdisk.device) buffers and caches entire tracks when
it needs to access single sector. Unless the disk is heavily framented
there isn't much of a problem. There also isn't much of a solution.
This subject was debated at length a few months ago in the Amiga groups
and the conclusion was (verified by benchmarks on other systems) that
disk head schleduling algorithms offer little improvement on floppies,
especially fragmented disks. The best solution is a cache.

>Can you say elavator algorithm ?, the Amiga systems programmers did n't.
>(I think the machine by friend bought was new, so this is the current
>release of the OS :-)

You are wrong. The head doesn't ping pong without reaching it's destination.
The head reads some data, runs back to the other side of the disk, reads
some more, etc. When the Amiga accesses a sector, it ALWAYS reads in the
entire track and caches it. You can get a simple improvement just by
doing a "addbuffers" command.

Commodore has STRONGLY warned developers not to use self-modifying code, mess with the MMU, use cpu busy-loops for delay, etc since 1986. That's why there's OS calls like GetCC() and CacheClear(). That's the real difference between the Mac/ST and the Amiga. The Mac used to pass data in the upper 8 bits of an address register probably because Apple never foresaw full 32-bit addressing. And alot of ST stuff uses priveleged instructions like move SR,<ea>.

Only the real old european game hacks don't work too well. When did atari set down CPU rules like don't use move sr,ea, don't put data in the upper 8 bits of address registers, don't use cpu busy loops (because they are CPU speed and ram speed dependent), don't use self-modifying code?

Well the Amiga has plenty of PD C compilers, I'll list the compilers
I know about.

PDC (PD)
Sozobon (PD)
GCC (PD)
C68k (PD)
DICE (PD)
NorthC (PD)

Lattice/SASC (Commercial)
Manx C (Commercial)
Comeau C++ (Commercial)

There are probably some more thatr I left out, however GCC and DICE
beat all the PD compilers. DICE is more Amiga specific. (BTW, the
author of DICE, Matt Dillon, is porting BSD 4.4 to the Amiga as FreeWare!
Don't think he can't do it either, Matt has single handedly programmed over
20 Amiga developer tools as freeware.)

>>
>PS. The Amiga is a fine machine for graphics, and quite good for sound, but
>it isn't ideal for some things, including I must say, programming in C.

You're gonna have to justify this statement. The Amiga has more
programming tools than I can count. Numerous C compilers, 4 Forth
implementations, Modula-2, Oberon, Smalltalk, Eiffel, Lisp/Scheme,
Basic (plentity of them including ones that produce optimized
assembly), AMOS, Fortran, the list goes on. Almost every
language has been ported. There are a couple PD interface builders
for GUI work, PD debuggers, not to mention that AmigaDOS looks and
smells like Unix from the shell point of view.
There is an entire (PD)C programming manual on disk that teaches
Amiga programming step by step. Not to mention the 590 fish disks
FULL of programs with C source code.

I'd say the Amiga is the second best computer to program C on
besides the NeXT.

763. SF314 Drive, PCDitto 2, DEAD 520ST for sale

Newsgroup: comp.sys.atari.st
Date: 1992-01-24 04:46:57 UTC
From: jking@nmt.edu
Message-ID: <1992Jan24.044657.4879@nmt.edu>
Source record: 226463

Greetings, my upgraded 520ST, after limping painfully along for several months finally bit the proverbial floppy disk. (One week after I finally got a hard drive too.) It doesn't seem to be worth trying to fix. So I'm liquidating stuff to get enough money on hand to buy an STe.

Here's whats for sale...

ATARI SF314 DS/DD floppy drive. I have two floppies and the STe will replace one. This one is in perfect working order and reads and writes with no problem for two other STs. (A 520 STFM and a 1040 STe.) I have the cables and power supply at school with me. If you really want the manual and orignal box, I can get them. I'm looking for $110 on this one.

PC DITTO II. I tried once to install it and failed. I'm not going to use it in the forseeable future. So it's up for grabs. I have all the cables, hardware and manuals. The thing has been treated very nicely. (The board has been stored in anti-static bubblefoam with the anti-static pad attached to the circuit trace side.) I'll start at $130 for this one.

Last but not least...

DEAD 520ST. It works sporadically but is bombing more and more frequently and more and more violently. I can't honestly see this as more than a "parts strip" or "mechanic's special". The following parts might be of value-
1 MEG memory upgrade. Custom made and soldered in by L&Y Electronics in Virginia. Worked flawlessly until computer died. (This is an OLD ST.)
MOUSE. This is one of the original heavy ball mice that I prefer to the later, lighter mice.
TOS 1.4 6 chip chipset.
40 WATT power supply. Bought from a third party after my Atari power supply blew up. Its a metal cased job that a spliced the old cable to.

That about does it. I'll sell the 520ST in pieces or together for $100. Make me an offer for the pieces.

All the above prices are definitely negotiable and we'll deal on shipping.

First reasonable offers accepted. (I may already have an offer for the TOS chipset though.)

JEff

Thanks to all the millions of people who responded to my DM question, I botted up the game and it took all of 2 minutes to finish off Chaos. I don't know why I never tried it before, I guess before I kept fluxcaging Chaos himself and he would always teleport... Anyway thanks again, now it's time for CSB (well I can't afford it yet but maybe I'll play it on my friend's (gasp! choke! eek) Amiga 500 down the hall, game looks exactly the same...

766. Re: Multifinder for Atari-ST ?

Newsgroup: comp.sys.atari.st
Date: 1992-01-24 06:39:06 UTC
From: sytang@lamar.ColoState.EDU
Message-ID: <1992Jan24.063906.38192@yuma.acns.colostate.edu>
Source record: 226462

Question was mutigem like mutifinder?
My personal opion is not really.
The multiGEM is a big step from the GEM but not real to the multifinder yet,
the use of desk accessary slot is not convenient and limits the function.
On Mac the multiFinder is only limited by the memory availible, and multiGEM
is limited both by the memory and the desk accessary slots left. No setup
needed for multifinder except to start the system with multifinder set as start
up.
As I say, this just my personal view, others would see it differently. You are
ultimat judge as you are the one use your machine not me or others. So if it
serves your purpose then it's good.

> MultiGem or Multifinder could someone else shed some light on this
> subject?

Well, I use MultiFinder on the Macs at work, and have MultiGEM on my STe, so I guess I should talk.

A quick background: MultiFinder is a version of the Mac OS (the Finder) that allows multitasking. With MF, you can run an application, adjust its window, go to the desktop, run another application, hop back 'n forth between them, and other such goodies.

MultiGEM is a software "hack" (albet a very good one) to give you multitasking on the ST (TOS 1.2 and up required). You install it on your system, then whenever you run a GEM program, it takes up one of your six accessory slots. You can hop back to the desktop, go to another active application, all sorts of fun multitasking stuff.

There are drawbacks with MultiGEM. It's a hack/kludge, so it's not perfect. Only GEM programs that"follow the rules" will multitask properly -- things that tend to break are games, early ST software, or PD/shareware efforts. The 68000 is not suited too well to multitasking, so if you are running several things at once (a word processor prints while you're working on a telecomm program), it will slow down noticeably.

Still, it's true multitasking on the ST, at least until Atari gets a multitasking TOS out. I admit it has flaws, but continue to endorse it -- it's not a final solution, but a good step in the right direction.

>Well for one thing the productivity mode is only available on the new machines with the new 2meg chipset. Older machines still need flicker fixer..
>The productivity mode is only a part of the new ECS chipset...

Yes, all new Amiga's come with AmigaDOS 2.0 and the ECS Agnus/Denise chips.
(Incidently, the ECS allows you to have 2mb of video "chip" ram)
The Denise is the video controller chip. The new denise offers
programmable scan rates up to 70hz (probably more). The ECS, unlike
the flicker fixers, outputs 640x480 at VGA frequencies, or 1280x200.
There are new interlaced modes like 1280x400 and 640x960 which are nice
for titling work. The new Denise also offers new types of external
syncing (genlocking), including chroma keying (overlaying live video
on top of graphics which is the reverse of genlock), bitplane keying,
and genlocking to any color register.

>But last I heard this was an Atari echo...
>Not only does high res on an st not flicker but it has a faster scan rate which is much better on your eyes..
>(Essentially interlace slows your effective scan rate down quite a bit...
> And the slower the scan rate the harder on your eyes it is.)

Interlace slows the refresh down to 30hz because it takes 2 fields to make
a single screen. The ECS modes are 31khz VGA style. However, slow scan
rates have little to do with how hard the image is on your eyes.
By far the most important factors are dot pitch, color quality, and
resolution. As long as the persistence is high enough, even very slow
scan rates don't hurt. (Consider LCD displays whose persistence is very
high, so high, that images "smear" across the screen. The refresh rate
is low.)

>
> * Origin: The R.I.P. (616)235-2313 [HST] (1:228/24)

P.S. You don't have to use the built in chips if you don't want to.
There are plenty of megapixel megacolor cards out there now, and a
24bit device independent graphics standard called SAGE is nearing completion
which would allow every application to take full advantage of them.

If you are running under GEM, have you tried using an editor which runs as a desk accessory? These are available in the public domain, and would be accessible from within your other program.

> modification of the source.

You have two immediate courses of action. Change Lisp implementations or use MiNT. The implementation of CL on atari.archive has an (ed "<file>") function which works admirably well, the actual editor called is settable in an initialisation file. If you *have* to stay with a Lisp without system calls (it can't be good for you), you don't have to go as far as running mgr. Allan Pratts mw2.zoo utility provides multiple GEM windows running the shell of one's choice (including gulam), allowing one to switch between windows. There's one slight difference between MW2+MiNT and MultiFinder, and that is --- under the former, programs continue running in the background.

You can find all the above-mentioned programs (except MultiFinder!) on atari.archive.

Hi People,

I downloaded UNIX2DOS.LZH, believing it to transmogrify UNIX text files to DOS text files, i.e. convert the <LF> record relimiters to <CR><LF>. However, I don't seem to be able to get the program to do anything. There were no docs, so I've been `shooting in the dark'. The program itself is only ~450 bytes long. Is the copy at a.a wrong? I am wrong? (Don't answer that...) Any clues and/or divine insight would be very much appreciated. Otherwise, I'll just have to write the program myself, and that's just not cricket!

Cheers,

Hi,

According to my recent posting about a D70 performance/patch/tone and
rhythm setup saver program for the atari-st I have the following to say.

- There is interest for such a program.

- Monday, I shall upload the program to both a.a.u.e and cs.ruu.nl

- The program will come with a file containing the complete factory setup for
the D70 synthesizer (so anyone can restore the original sound settings
if the program).

- Hope I will hear from users of the program.

Geert.

I agree with you that compilers make a difference. I thought that was
clear at least from my statment about Alcyon vs. MegaMax vs. GNU. I also
consider 10 percent to be significant. My quest for speed started this
whole dialog. I still say that given the state of the art in compilers
that the major difference in my origional example is hardware. While I
appreciate your concern for not abusing benchmarking, I can buy or write
a better compiler. I can't speed up the memory system once I have
purchased the hardware. Which brings us full circle. My current non-GUI
system is a homebrew 030 at 20 MHz running 5 cycle access to memory without
burst. It gets around 5600 dhrystones using dnry 2.0 and GNU compiler.
Given similar test conditoions, will a TT be faster? How good is the
TT memory design? Should I instead get a Small SST and an old Mega?
How good is the SST? What would you buy with $2500?

I suppose you're entitled to your opinion, it's how you come to that conclusion that beats me. Both the Mac, the ST and now even the PC all have consistent user interfaces that impose rigid styles on the programmer, providing him with the tools necessary for simplifying design and implementation. By contrast, the Amiga's so called GUI has all the hallmarks of something thrown together in rather a hurry (maybe it was ?). It provides virtually no services to the poor sod who has to program it - have you ever tried to enter data into a complex Amiga dialogue without resorting to the mouse ?

In short, the Amiga's designers should have read the Apple style guides before they even touched a keyboard. I apologise for bringing this to c.s.a.s but it was the Amiga's amateurish interface implementation that kept me on the Atari.

Andy.

There is one computer that you forgot about beats, them all hands down,
its the Acorn (UK) A540/A5000, its a RISC machine and get a 26 mips performance,
so why not go and see if you can find one to look at..

Yes! I think there is. And if you include people like me (who don't yet own a spectre but who are diligently scraping together every loose nickel and dime they have to get one) you would find quite a bit of interest.

And with a newsgroup for spectre users, it would just help increase it's own size by giving those folks who (somewhat like me) have been living under a rock (or just nowhere near an Atari dealer ... oops, I guess that's just about everybody :) the chance to learn more about the product and its capabilities, making it more likely that they'll get one.

Just MH2CW,

Rick

I certainly agree -- I get tired of adding kill file entries for each new
idiot that comes along with a commodore and an attitude. Never mind the
relative merits of their computers; I am now convinced I would NEVER buy
a machine that caused its users to go wandering around picking fights with
owners of other brands! Does the monitor put out some special radiation
that causes brain damage? Maybe there are subliminal messages that
'flicker' past and incite people to mindless acts of .... (STOP IT!)

OK, here it is:

grab the power gem with the firestaff. turn around. throw firestaff. leave.

There is a trigger in the doorway that goes off when you go accross with the firestaff. If you listen carefuly, you can hear it (that is how I found it).

E. Arthur Brown sells it, but I don't know whether they ship to France.

You can do pretty much the same thing with most versions of MicroEMACS
(and, I think, Origami as well). I usually compile C code directly from
my editor, using Sozobon C and a version of Conroy's MicroEMACS that I
compiled with Sozobon. But note that the compiler doesn't stay resident;
it has to be loaded for each pass.

If you have enough RAM to hold the Lisp interpreter on a RAMdisk and still
run it, that might speed things up considerably.

It sounds like what's really needed here is just a task switcher, like
the old Juggler program. I don't know if it's still available, or if it
supports non-GEM programs. Never used it.

G++ has been ported, I think it's on nic.funet.fi. Turbo-C, who cares?
The ST version isn't even made by borland anymore? Not to mention that
GCC beta2 beats most commercial compilers anyway.

If the program you mentioned is the one I know of, it can display Hi-rez screens on the desktop background too, just with a different filename!! But since I don't have this program (anymore) I'm sorry, but I can't tell you the filename! But if you use a disk monitor to have a closer look at the program you might be able to find out what filenames it loads...
M.Yannikos
PS. The program I mean is 2048 bytes if I remember it well...

I downloaded a bunch of clipart files from a.a and they are in some sort of GEM (.img) format. How can I convert these into MacPaint or PICT images so I can use them on my GCR??

Bob Malay

789. Does anybody know...

Newsgroup: comp.sys.atari.st
Date: 1992-01-24 20:29:51 UTC
From: kdv_521@eimoni.tuwien.ac.at
Message-ID: <1992Jan24.202951.11296@email.tuwien.ac.at>
Source record: 226486

Does anybody know...

- How to connect a second SCSI harddisk to a Mega STE, without having to buy a tower kit? Is it possible at all with the built-in SCSI controller?

- Why the gnu 'gcc.ttp' can't run in the background under MiNT 0.91, if called with '&' the next programs called can't get a PROC structure (at least that's the message I get :)).

- If there is an accelerator board available for the Mega STE, using a 32-Bit processor (maybe even an 68040???).

- If a 68881 coprocessor can be used directly with line-f floating-point instructions in the Mega STE when connected properly, since the line-f vector isn't used by GEM anymore?

- Which graphics cards's video memory can be accessed directly by programs without having to use hardware registers, drivers etc., i.e. using normal move instructions??? (I mean the new VGA cards)

Thanks in advance,
M.Yannikos

From: steveg@cseic.saic.com
Message-ID: <4991061@MVB.SAIC.COM>
Source record: 226502
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I'm using John Dunning's port of GNU Emacs and like it alot except for one annoying problem. Can anyone help me:

Get the file loader to stop stripping out Ctl-M's (cr's) from my ST text files? It's a real pain to have to replace all LF's with CR/LF pairs everytime I go to save, and GNU Emacs on my Unix box has no trouble preserving 'hard' CR's, so why should the ST version?

Similarly, how would I go about creating a mode (or defining the key) so pressing enter caused CR and LF to be inserted?

(Bonus Question): What is the name of the .el file (and where does it live) that I can put startup commands into? On my Unix box here it's ".emacs" but that obviously won't work on the ST.

>the TOS, but I'd like to be sure, so that I don't order the wrong set
>and find out from the installation instructions that I was looking at
>the wrong thing and really need a 2-chip set.

Ok. In my Mega, the ROMS were sitting quite close to the 68000 and no-
where near the power supply. The ROMS will be sitting in plug-in sockets
(not soldered in!) and I believe they are labeled with numbers beginning
with 'C09...', or at least 'C0...'. Oh yeah... and the sockets should be
labeled U0, U1, U2, and L0, L1, L2 (for six chip sets, which you probably
have.) The three L sockets might be alternately labeled with U* instead.
Hope this helped.

I have a feeling I'll regret posting here, but here goes anyway:

In article <1992Jan24.020204.2421@actrix.gen.nz> Roger.Sheppard@actrix.gen.nz (Roger Sheppard) writes:
>Well I quoted negative sales, meaning that they are taking there A500 Plus
>back to the shops as they don't play games any more.
>One shop here stated to me that only 2 games in the shop would work on
>the New A500 +.
>The games that are packed with the machine, most don't work, Commodore
>include a list with the machine of the games that don't work..
>And even Lemmings does not work, is that a old game..??

Commodore laid down rules long ago about what not to do to
maintain compatibility. If the rules were followed, the software
generally worked. If not, it's the developers' own fault.
Lemmings works fine on my A3000 running the same version of the OS
as the 500+, with the added complication of a 25MHz '030, different bus
structure, etc. Not all old games fail either... I can still run Defender
of the Crown (probably the first Ami game, released something like 7
years ago) on the latest hardware.

>All this has been confirmed by 2 other Amiga Shops here

My statements are confirmed by the machine I'm typing this on :-).

>Hey this new work bench that they have still can't lasso files, to
>copy or delete..

Funny, I do it all the time. Maybe I've got some sort of virus that
adds lassoing capability to the workbench?

>And they still use Sum Checks on all there disks..!!

Uuhhhh... so?

I'm curious as to the state of Atari in Europe at this point. Nothing
in this post is meant as a flame or insult; I'm just trying to offer
corrections to some inaccuracies and ask some honest questions. No, I'm
not an Amiga user who skims the Atari groups looking for flame wars to jump
into. I occasionally peek into c.s.a.st out of a genuine interest in what's
going on in the ST world.

OK, now that the flame retardant has been applied, back to my question:
how is Atari doing in Europe? From the little I've heard lately it sounds
as if they're heading downhill there and picking up speed. Is the TT selling
much? I have yet to see a TT in person. There are, as far as I know,
_no_ Atari dealers or users' groups left in this (admittedly small) state,

and all 3 ST users I've known have long since moved on to other machines.

What kind of features does the latest TOS have? I don't even know what version it is, which machines it runs on, etc. Could somebody maybe send me some informative screen shots (in GIF or IFF format) :-)?

Oh, and a note to whoever posted part of this thread to c.s.a.advo with a 'Please get this out of our newsgroup' type heading.... not a good idea. It only attracts more of us insecure, jealous Amiga users into c.s.a.st to see what's going on, and steamrolls into a cross-posted flame-fest that can go on for months.

If you followed that advice, you'd never have bought _any_ computer
at all. Maybe a used Vic 20 ("I know it's a piece of junk, but I bought
it because nobody who owns one ever says it's better than anything else!")

As far as I know, you cannot pop a 2-chip set into 2 of the sockets on a motherboard designed for a 6 chip set. That would mean that each socket must be addressed as if it were actually 3. Toad was quite adamant in its advertisements about making sure which set you needed (which is why I went through the ordeal of opening up my Mega to check!)

799. Atari SF314 DS/DD drive for sale

Newsgroup: comp.sys.atari.st
Date: 1992-01-24 22:18:50 UTC
From: snoret@egon.unx.sas.com
Message-ID: <1992Jan24.221850.11597@unx.sas.com>
Source record: 226392

I have an extra SF314 drive I would like to sell. It has
original box, manual, and power supply, but I still need the
interface cable (sorry). I thoroughly tested it before I boxed
it up. It works great.

Price: $75 or best offer. Does NOT include shipping.
Terms are cash, MO, or UPS COD. (I prefer the two latter.)

>---
> Larry

This problem is not as hard as it may seem. Try going down the stairs
marked v on the map above. Walk ahead to the iron door. You open it
by forcing a skeleton to stand in front of it, then quickly pressing the
button nearby. This should cause the skeleton to be transported to the
other side of the door. Now quickly kill the skeleton. (Throw arrows at it
or somthing, through the door.) The door will open. PRESS THE EYE ON THE WALL
with some transparent object, e.g. a magnifying glass or a gem. This will
close the pit (marked 1 on the map). Just go back upstairs and game on... :-)

Good luck!

801. Questions about TOS versions

Newsgroup: comp.sys.atari.st
Date: 1992-01-24 23:42:23 UTC
From: thaanuj@prism.CS.ORST.EDU
Message-ID: <1992Jan24.234223.15404@CS.ORST.EDU>
Source record: 226496

Anybody out there swapped the new TOS 2.06 into their old ST?
How tough is it to install? I'm also wondering how the new TOS deals with
things like lack of Blitter, only 512 color palette, etc.

Do any of you know if Falcon runs under 2.06? I've had 1.4 installed for
a while, and my copy of Falcon craps out at the "Insert Disk Two" prompt.
I like the game, but not enough to justify ripping the cover of my machine
and popping 1.0 back in every time I want to play it.

So do I get TOS 2.06, or sell Falcon, or just quit asking so many questions?

Thanks,

>> Heh heh....

GEE. WOW. Are we Atari users being enlightened by the Amiga cult users?!

There are many Amiga newsgroups and a few Amiga users have to pick
comp.sys.atari.st!

The question of the hour is: WHY?

Their continual gripes, denunciations, and immaturity is clogging our group!

Are they trying to lower our moral? Or are they disturbed?

(Please NOTE that this is directed at the immature poster NOT some other
computer user correcting mistakes in posts of Atari users).
^^^^^^^^^^
Are you going to move to Japan because the US' economy is down?

All I can say is: SHUT UP.... it's getting ridiculous!!!!!!!!

OR they should flame through Email!!!!!!!

Hi, This could be FAQ but here it goes:

I am attempting to write a vertical blank routine which will
maintain a simple timer by incrementing a counter.
I think I need to know the monitor refresh rate to assign a
real world value to this (or do I?).

Comments, better ideas, clarifications are definitely welcome.

Oh, by the way, the language I am using is assembly.

Replies by posting here welcome, or e-mail them and I will
summarize.

Unix2dos is a neat little program that makes the system recognize
forward-slashes (/) as directory separators instead of back-slashes.
I run it from my auto folder.

The only problem I have with it is that I can't used it to input a
top-level directory as just "/". The version I have is 1.2. Does
anyone know of a more recent version that can handle "/" to mean a
root directory?

{Other dribble deleted for brevity}

What does owning an Atari ST have to do with being able to read comp.sys.atari.st. I don't recall owning something was a prerequisite for reading a newsgroup. Anyone with an interest in reading about Atari STs are entitled to join in. If you want to keep out unwanted posts in a newsgroup I would suggest having the newgroup moderated but until then anyone is entitled to read and post news though this does not forgive those who only enjoy flame-baiting and those who have to use derogatory remarks to get there points across.

Sorry, I keep reading posts from self-proclaimed net police to get out of a newsgroup when they have no authority to do so. Just because someone posts something another reader doesn't like, we get these ravings of "GET OUT OF HERE". This is a forum for discuss not censureship.

"How did you get the ICD Utils to see the TT SCSI BUS?"
Any version of ICD after 5.2.x (currently 5.5 here in UK) sees the SCSI
bus on the TT. For some reason though, I have one TT SCSI Hard Drive and two
ACSI Hard drives off an ICD card, and although it all runs just fine, the
IDCHECK and RATHD progs dont see the ACSI drives anymore. They used to see the-
m
when there was only one external drive.
Any comments ICD?

809. Re: TT Fast-RAM for sale

814. Forsale -- Supercharger with 8087-2 installed

Newsgroup: comp.sys.atari.st
Date: 1992-01-25 10:39:31 UTC
From: sytang@lamar.ColoState.EDU
Message-ID: <1992Jan25.103931.51702@yuma.acns.colostate.edu>
Source record: 226413

I have a supercharger with 8087-2 installed in very good condition, including the software 1.4 (MSDOS 4.01 disk is included) FOR SALE.
It's standard supercharger (V30, 8MHz, 1MB RAM, DMA connection) with the FPU 8087-2 (8MHz) installed and tested. And external power supply included.
No hardware hack needed, just connect it to your ST DMA port and run the software. PC and ST run at same time (supercharge has its own 1MB memory so won't run over ST's memory space). The 1MB can be used as RAM disk when not running the PC emualation.

Reason to sell: Don't need to rum MSDOS program now and time to get SST.
Make offer, all offer considered and will accept reasonable offer.
Thanks.
Tang

Actually the last ST Report had the supra ad. and Supra is offering
the new modems at a special price to BBS operators. A really good
deal.

Did you also notice that the new modems are also send and receive
faxc modems? And that Supra has Fax sw only for the IBM PC and
the macs? so, both STers and amiga users can use the modem only
as data modems, not as FAX modems.

seems kinda strange that Supra isn't releasing ST FAX sw to
use with their fax modem!!

> --Rob

Sory but this is not correct..

Here are the Atari mother board part No's. that can use 2 or 6 chip Rom Sets..

Megas ...C100501 mega 2..
C100167 mega 4..

ST's ... C070789 1040 ST
C103225 1040 ST
C070243 520 STF

All these boards have jumper options for 2 and 6 set roms..

It is far better to fit 2 chip sets as there is less loading on the buss,
this was also mentioned in some GCR notes..!!

I rest my case..!!

From memory there was a fix for Falcon..

One or two games failed with TOS 1.4 because of the way hidden files
now work, one from memory was Chonoquest...

Is this CPX available somewhere in Europe?? (It's not PD or shareware, is it?)
BTW, could you tell me how I can configure the cachexxx.prg to use a specific
amount of FAT and DIR/DATA buffers when in the auto folder? (Well, I know
I could write a program that executes cachexxx.prg with parameters from
the auto folder, but can it be done otherwise?)

Source record: 226417

Well, actually I seem to have only 46.13 Megabytes on my Harddisk (Mega STE)!
But those bytes must be used for FAT's and partitioning data....

Here's something I always wantes to ask one of Atari's system software
programmers:
Why did Atari wait until 1990 to release such perfect programs like
the mouse speeder, the new Control Panel etc., what have you been doing
the past 5 years? Maybe in 1985 the good old desktop was sufficient, but
5 years are a long time for computer systems!!! And about those developer
packages, which, as I have heard can now be bought from Atari in Germany
at about 150DM, if this had been done some time ago, there would be much
more really professional software (like Calamus etc.), which is about
the only advantage the Macs have!! Today the computer buyer expects to
get professional programs for every purpose, even when he chooses a lower-
priced system. I HATE to see programs on my Mega STE that crash because
3 years ago people used undocumented line-a variables etc., NOT only
PD-software!!
Fortunately Atari seems to be on a better path now, but still, the software
you get when you buy a Mega STE (from Atari) is not what you expect to get
with a computer! I'm not trying to compare Atari's to PC-Clones (because
the latter are in fact worthless to a guy who dosn't know what do do
when he runs out of memory, and what all that stuff in the config.sys
means, how to read documents on the disk etc. etc. etc...)
but at least when I bought my Mega STE I expected to get some sort of
backup program (I had heard of Harddisk Utility being distributed by Atari
in Germany) or harddisk-cache!!! Why did't I get cachexxx.prg since it's
Public Domain anyway?? (At least it's available through Internet, though
I doubt the majority of ST Users has access to it)
Also, some more CPX's would be great, a printer installation CPX for various
hardcopy formats on various printers!!

Well, that sounds like too much criticism, but what I also wanted to tell
an Atari-guy (sorry! :) was that I think the Mega STE is GREAT, fast enough
since I don't need to use programs like Windows etc. to get a better desktop,
I was really pleased that the coprocessor only cost me 600 ATS, (~85DM),
that the Harddisk, even though its one of the slowest SCSI's, has transfer-
rates of about 550KB/sec. (which many '386er users dream of!!!) and that
the keyboard is really good, not to mention the SM124!! (and the SC1435)
...And, which surprised me most, that the computer is really 'clean' inside,
a really good design (as far as I can judge that), and it was a great idea
to make access to the RAM's, the ROM's and the harddisk and DIP switches
so easy, just by removing a single screw!!
Actually, the only thing I still want from Atari is a 1,44MB floppy controller
upgrade!!

Marinos Yannikos

PS: Sorry about that excessive verbosity, but I really had to tell these
things to someone!!!!!
Keep on doing that great little programs like the Mouse Speeder!!

Yeah! I don't know why people always think they own the BEST computer,
they need to own the BEST computer, and they have to convince everybody
else their computer is the best and so everybody must buy it!!
I'm happy with my Mega STE, and if the Amiga has better graphics, and
a multitasking OS, and there are more games available, well,
it would be nice to have better graphics too, but I can live without them,
and MiNT is very good too!! I don't want to say my computer is better, it
isn't, it just fits my modest needs better!!! And of course, since I'm
an Atari user since 1984 (800XL-130XE-520STFM-MEGA STE4) I'm so used
to these machines, that I wouldn't be a good Amiga user anyway!!

These V32bis modems have a line speed of 14.4k and with V42bis it is
posible to get about 20k on a packed file, a UK magazine tested a
few of some high speed modems, the codex one had a tested speed for a
text file of 36k but droped to 20k with a Zip File..

From: theo@mailmak.swb.de
Message-ID: <187@mailmak.swb.de>
Source record: 226317

Howdy !
After having read the articles about Vortex's new 386SX Emulator, i got
the (crazy ?!) idea to run XENIX or perhaps (more crazy ?!) SCO UNIX on
the ST. I read a test about the Emulator and even 'problem-software'
like Borland's Turbo-Debugger shall work. Should it really be possible
to run *IX on ST's ?

greetings Theo

> concerning the UNIXMODE compared to the `standard' libaries of GCC?
>

UNIXMODE isn't (much) supported in the MiNT libraries because I hate UNIXMODE.
It's the wrong solution to the long file names problem. UNIXMODE works only
with programs compiled with the UNIXMODE library.

The "correct" solution is to put handling for long file names and/or case
sensitivity into the kernel. MiNT has done this by providing new system
calls for handling symbolic links and directory searches. That's why,
for example, MiNT can read Minix style file systems -- UNIXMODE programs
tend to do very silly things when confronted with non-DOS file names.

> Probably it could be a nice idea to use an AUTO-folder-program as a realization
> of the UNIXMODE so that ordinary TOS executables are also able to share
> UNIXMODE.
>

Exactly. I hear that someone is working on such an AUTO folder program.
It should be (relatively) easy to write a UNIXMODE loadable file system
for MiNT that would have the same effect. I don't have the inclination to
do this (I have Minix file systems set up on my hard drive) but I'd
be willing to help anyone who wants to do it. tcsh uses the new
MiNT system calls for searching directories, so it will be able to
complete long file names once the proper file system driver is in place.

gcc-cc1.ttp, gcc-cpp.ttp and probably gcc-ld.ttp, as distributed, allocate
all available memory, so there's no memory left to run another program.
You can use the 'fixstk' program to change this behavior, e.g.
'fixstk 256K gcc-cc1.ttp'.

830. Re: Atarians! Where Are You?!

Newsgroup: comp.sys.atari.st
Date: 1992-01-25 17:03:22 UTC
From: Azog-Thoth@cup.portal.com
Message-ID: <53381@cup.portal.com>
Source record: 226430

You know, its kinda funny. All these Amiga people bashing Ataris, and vice versa (and yes, I am guilty on that count). The Amiga people like to throw numbers around about their machines, but stoop to just calling the Atari ST a toy computer.

I dont mind seeing comparisions between machines, but youve got to have meaningful comparisions on BOTH ends. Ive seen a few articles where Amiga people claim something like:

My Amiga gets 1 million gallstones, the Atari cant even do 10. (fictious rating, gallstones, but in this point, a gallstone is something only the Amiga can do)

Get the hint?

Someone also pointed out that the Amiga GUI looked like it was a hack job... I would like to point out that the Amiga was not developed by Commodore. Who, I forget, but Commodore purchased the rights. So chances are it was a hack job by the original developers.

Youve got to admit, the Amiga has some things I wish the ST had. Ive a friend whos got a 2000, with 37mb of RAM. Wish I could get that out of my STe... (maybe with a TT, you could, but TT fast RAM is expensive)

And dont forget, most of the people who purchased Atari STs purchased them of their own free will...

Billy D'Augustine

831. Various ST topics

Newsgroup: comp.sys.atari.st
Date: 1992-01-25 19:53:51 UTC
From: ec333way@sail.uwaterloo.ca
Message-ID: <1992Jan25.195351.26589@watserv1.waterloo.edu>
Source record: 226535
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I was able to read my first post to the newsgroup, but it seems that either 1) it didn't make it out to the rest of the civilized world or 2) no one felt like replying.. Would someone at least respond (from outside of university of waterloo) so that I know that this did reach the 'net'??

I have several questions: is MiNT at all usable on a 1 meg ST?
Is TeX Usable on a 1 meg ST w/ hard drive?
If the answer to either is yes, would someone PLEASE either send me a list of files I need, or point me to a file outlining which files I need? I can access most of the free world through ftp, so I can get the files myself.

I recently got bash-bin and bash-doc (in lzh format) from a.a.u.e...
LHA (on the PC) wouldn't unarchive either one, lharc would, but the bash-doc file was messed up, and the bash.ttp ran and returned to desktop in 1ms.. Did I get a bad copy, or do I specifically need to unarchive them on the ST??

Also, I'm interested in whatever happened to Megamax as I have Laser C and am wondering if a later version is available.

Regarding the 2/6 TOS chipsets - I opened up my 1040STFM, and found 2 chips in sockets, with the other 4 punched out on the PCB, but 'soldered up'. I haven't checked the serial number with the one posted here before, but is there a chance I can get the 6 chipset to work? What is the retail price of tos 1.4 right now?
Or, how much is 2.06 right now for the older ST's?? I have a socket for blitter on my motherboard as well - does this mean I can buy one and stick it in? Is there any purpose to this - ie do more than a handful of programs actually use it? Will it work? How much is a blitter going for, and where can I get one?

I would be very appreciative for answers to any of my questions.

Mattias Hembruch

Please reply to either 1) the net,
2) mghembruch@electrical.watstar.uwaterloo.ca or
3) ec333way@sail.uwaterloo.ca

Firstly.. I said that it wasn't ideal, I didn't say that it was horrid or anything else.

Secondly.. I wouldn't quite put it just behind the NeXT (but that's a purely personal point of view). There is C programming and C programming, if you are talking about program development for one platform only, then, yes, the Amiga is quite a nice platform.

I must admit that before your posting I knew of only three C compilers for the Amiga, they being Lattice, Sozobon and GNU. In my optinion (and that of a couple of Amiga programming friends), Lattice C (version 5 point something) is not a simple compiler to use and has a major bug in its implementation of the vprintf() function in its library. The last I heard of Sozobon was that it didn't come with a library. I knew nothing of the GCC port other than it existed.

>>--

Steve

PS. I was not flaming the Amiga, it is a fine machine. It's just not quite my cup of tea. Lets build bridges between our communities rather than divide them, good things can come of this, such as the Sozobon compiler for the Amiga. Maybe a nice Amiga owner can write a program which will be of a great use to Atari users.

833. Anti-flamewar proposal.

Newsgroup: comp.sys.atari.st
Date: 1992-01-25 21:54:55 UTC
From: wmagro@roma.physics.uiuc.edu
Message-ID: <1992Jan25.215455.14648@ux1.cso.uiuc.edu>
Source record: 226431

If you hate posts that respond to flamers, read on. This one is different.

I own an Atari 1040 and a Mac SE. I work on Sparcstations and a Mac IIx. I feel qualified to discuss my likes and dislikes about each of these machines, because I use them regularly. I love my Atari and I always amaze people when I show them what it can do.

The problem with flamewars is that each amiga or atari user roots for their own machine and picks on the other guy's machine. I don't like flamewars, but I do enjoy comparisons of various machines, even if I have no explicit plans to change computers as a result of the discussion. Since newsgroups are a forem for discussion, our newsgroup is a natural place to hold such a discussion.

I therefore feel that it would me most informative if each user were to say what they _dislike_ about their machine in addition to what they do like. In this spirit, and understanding that people have already rooted for the ST/STe/TT's good qualities, I'd like to say what I don't like about my ST. I invite a humble Amiga owner to do the same.

"Why my Atari 1040STf Sucks," by Bill Magro

I) GEM/Desktop has a lot of problems
A) Mouse events are not registered quickly, so if I click on a button and quickly move the mouse, the button doesn't see the click. Very annoying, and it slows me down.
B) I have to bring a window to the front before I can launch a program from it. In the mac's finder, if I double click on an icon in an obscured window, the window comes forward and the program runs. In GEM the window just comes forward. Arghh! This slows me down.
C) I can't arrange my desktop in any efficient way. Not being able to put programs on the desktop or to arrange them freely in a window makes launching programs a nightmare. This slows me down.
D) There is no effective and consistent multitasking environment. This is the 90's. A lot of people ask what the big deal is about multi-tasking. There isn't one until you use it for a week or so and then try to go back. I don't know how many Atari owners use their computers for real work. My work is scientific computing and I need to log into the big computers and do runs, then grab the data and graph it immediately, then update my TeX document with the results. I cannot do this right now with my ST (I don't have multigem yet). Atari really _needs_ multitasking.
E) Do we really need to reboot to change resolutions? Come on Atari, you can do better than this.
II) Hardware bitches

A) Why is TOS in ROM? What a stupid idea. Sure I can turn my computer
on and get a desktop without a long boot time. That is nice.
Unfortunately, if you hate the Desktop (see above), every time you
turn the computer on you _have_ to see that desktop. Almost any piece
of software is obsolete the day it is released. Putting your operating
system in ROM is like a 19 year old who gets "I am 19 years old"
tattooed on his chest. Atari only hurts itself by putting the OS out
in such a difficult (and expensive) upgrade format. Programs like
neodesk, folderxxx, pinhead, etc. should not have to exist.
B) Our graphics modes suck. 640x400 mono is great for work. But everyone
else has at least 640x400 256 colors available now. The new TT
resolutions should be in _all_ of the machines by now. Come on Atari!
C) We need a bus (or buss if you are a total computer nerd)! People
like to upgrade their machines. If you don't make provisions,
people will hack up their machines anyway. (VME bus in Mega/TT is
good).
D) The power supply/keyboard/mouse all suck. The keyboard is mushy, but
reliable. The power supply is too weak (mine has burned out twice in
three years). The mice don't feel very nice and are prone to quickly
wearing out. (Again Mega/TT seem to deal with this.)
E) Non standard connectors. ACSI, monitor and drive ports, a male rs232
port?!?!?! Come on! If you are going to introduce new connectors, at
least give them advantages over the standard connectors.

Why do I _love_ my ST? For the same reasons every other owner does. It is
an awesome computer, just a little outdated. Ok amiga/mac/pc/acorn/next/sun/
ibm rs/hp/decstation/vaxstation/cray/timex/ncube/connection-machine/SGI iris/
commodore64/atari8bit/pet/appleII owners, it's your turn. What do _you_
hate about your machine? Let's let each owner cut their own machine down.
Then we might actually learn something from these discussions.

By the way, if you decide to followup on this article, please don't include
the whole thing and respond line-by-line. Can you imagine anything more
agonizing than having to read this again in its entirety?

--Bill

835. Supra Interface PROBLEM

Newsgroup: comp.sys.atari.st
Date: 1992-01-25 22:36:15 UTC
From: ba014@cleveland.Freenet.Edu
Message-ID: <1992Jan25.223615.22106@usenet.ins.cwru.edu>
Source record: 226432

I've got a Supra ST DMA->SCSI Interface that's about a year old (It's got the clock on it) and I'm having some <gasp> troubles.

I've got two ST-125N 20Meg SCSI Drives I'd like to hook up to it. I can get them to work by themselves, but they won't work cabled together on the interface. The SUPRAFMT.PRG recognises and partitions both drives, but GEM/TOS tells me that drive "E" doesn't exist (the first partition on the 2nd ST-125N.) Both drives are terminated, otherwise I get erratic results from both drives. The Supra documentation discusses drives that may supply termination power from the SCSI bus on Pin 26 of the cable - and suggests clipping that pin between the two drives. However, it also says that the drives would likely not spin at all if that were the case.

Any hints, clues, etc. before I resort to Supra tech support? Last time I called them it took forever to get thru only to find out that the guy on the other end couldn't answer my question...

>
>Do any of you know if Falcon runs under 2.06? I've had 1.4 installed for
>a while, and my copy of Falcon craps out at the "Insert Disk Two" prompt.

There's good news and bad news. The bad news is a _lot_ of games
don't work on 2.0(5,6) and Falcon is one of them. Also FOTI and numerous
others. A freind tells me the keyboard handler was changed, and this is
what breaks some games.
The good news is your Falcon should work on 1.4. Just write protect
disk one. (Or was it don't?) It was discussed when the game came out,
and the fix is that simple.
If this is not the case, get in touch with Spectrum Holobyte, as their
support is excellant for their existing games, even if they aren't
converting any more. You can upgrade to the latest version, 1.2, for
$15.

From the Holy Book of <ENTROPY.92Jan23184939@wookumz.gnu.ai.mit.edu>
as spake by entropy@gnu.ai.mit.edu (maximum entropy) :
>I'm considering doing a TOS 1.4 upgrade in my circa-1987 1040 ST.
>(rev. D motherboard.) Where are the TOS roms located? I found a
>group of 6 chips under the power supply that looks like it might be
>the TOS,

That's where they were on my Nov. `85 machine, so you're probably set.

> but I'd like to be sure, so that I don't order the wrong set
>and find out from the installation instructions

What installation instructions? :)

[Well, that's slightly unfair; the company you order the upgrade from might
supply instructions. Toad does. Atari doesn't.]

Message-ID: <1992Jan25.192559.22642@jarvis.csri.toronto.edu>
Source record: 226435

I tried the QuickST2 demo on my TOS 1.0 1040ST and noticed quite a speedup. I'll be upgrading to a MEGA_STe soon and I'm wondering whether QuickST3 is still worthwhile to get, or has stuff been cleaned up in the MEGA???

I also ftped the CrackArt drawing program from atari.archive. Wow, never realized how good low-rez could look. Does anyone know of English doc (the original docs are written in German).

Thanks,

VIJ...

Message-ID: <1992Jan26.014521.29382@loop.uucp>
Source record: 226444

With all the activity of selling ST's, does anyone have a faster version of BASIC or a BASIC compiler for a 520 ST that they would sell inexpensively? How about any math related software, or maybe fractal or chaos or simulation or neural net software?

(I gave a friend an ST and he really resists learning yet another programming language but some of the math work he is doing is really going slowly in BASIC)

On another note, if anyone can tell from the return address on this WHY I can't get a peep out of the atari archive mail server I would be greatly appreciative. I would love to get some files, like the SubCal package but have not been able to ever be acknowledged. Oh, do we need a real domain address around here.

A couple quickies.... one, I think only the last drive is supposed to be terminated...

two, what interleave are you using? I just put together a ST296N with a supra interface and had to use 2:1 to get things to work properly... (suprised the heck out ofme, since I expected a 1:1 to work...)

One think that could fix one or two of your gripes could be Neodesk III
or say the new TOS 2.06..

There is another Big computer in the UK, Acorn A5000 that has 2 megs bytes
Rom of RISC OS, with a lot of sotfware built in, these computers , they
have a range, (the A5000 is one of there latest), are aimed at schools
and Universities..

You only terminate the last drive in the chain, if not the Supra host adapter
can't drive all that load..

What addresses have you set your drives for..??

On another note can you tell me the part No. of your clock chip in
the Supra host adapter, this is the big ic.. 24 pins..

I ended up changing the clock IC, to a Dalas one, I also rang Supra
but did not get mach help at all..

What version of Laser C do you have. The last version, released ages ago was 2.0 (or was it 2.1? I forget.) At any rate, new versions are not forthcoming.

Why do I hate my PC?

It is a 286... it is functionally obslete. It is not a good game machine. I've put too much money into it... for what I spent a year ago, I could have an awesome machine of some other sort.

Why do I like my PC?

The standard machine. Everything available for it if I could afford it. Parts are cheap. It is modular (I'm not afraid to open up the case and fuck with things... it is easy). So, for instance, when my motherboard dies... at it is in the process of doing... all I have to do it opne up the machine, yank the thing out, and pop another in.

Peripherals are cheap.

Disk controllers cost $11... add 2 serial ports and a parallel, and the price is $24. I *never* pay retail. There are tons of used parts out there... the swaps are dominated by PC parts... I can buy a used 40 meg ide drive, add an $11 controller, and I'm set. I don't have to pay $129 for a disk controller, like I've seen elsewhere. 20 meg used drives go for $30...

However, I costs $1000 to get a basic machine, vs. $500 for a basic ST/Amiga (Macs, on the other hand).

Anyway, I'm working on getting an Amiga... if anyone will sell me an ST for $175 (how much would it cost to hook it to my multi-sync?) I might consider it as well.

Anyway, entertainment wise, I feel IBMs suck, which is why I'm looking into the Amiga/Atari sectors...

850. Sozobon C heat-n-serve

Newsgroup: comp.sys.atari.st

Greetings Atarians, I need some help with the Sozobon C I just got. I have installed it on my 520 w/DS floppy, and it is working well so far (having 2.5 megs helps I think).

Anyway, I need some help on accessing functions, like XBIOS and BIOS and that type of stuff. Where can I get more information on using these functions, I really have no documentation about them. Just as an example, I would like to know how to clear the screen (VT52 maybe???) and plot a point or draw a line...

Please respond by e-mail, I imagine this is an easy question and a lot of people may have suggestions... As you can tell I am new to C on the ST so I am sort of lost at the moment.

Thanks in advance, Ben Gilbert (tymbrimi@u.washington.edu)

Just get the current updates. For TT usage, ICDBOOT V 5.4.2 is
required.

Check out your PostScript File if it contains a '\showpage' command
anywhere at the end... If there ain't any, add one. If there is one,
I have no further ideas at the moment.

Hi folks,

does anybody know a public domain program that reads files in
Hewlett Packards HPGL language and outputs them on a ST/STe/TT ?

Alternatively, is there PD program converting HPGL files into
Postscript ones (maybe executables i.e. (1) *.ttp _or_ (2) *.ps
for a suitable programming of the Postscript Printer)
qquit

No, it was Amiga Corporation, founded by a bunch of rich doctors who wanted to invest their money. Jay Miner (of Atari 8-bit design fame...) and a number of others got together & started working on it, and were funded by Atari to the tune of a few hundred thousand. Apparently Atari assumed they had some kind of agreement set up to buy out Amiga, Inc. when the machine was done, but it never happened because Commodore got there first.

As _not_ documented, right clicking on the program to launch, then
double clicking with the left butoon solves this problem. Tos 2.06 solves the
docking programs on the desktop problem, though, IMO, Gemini does it better.

Well, things would probably get done a lot quicker if some genius at
Atari hadn't decided that it was more cost effective to have less staff
than sell more computers. ;-(While on the surface this idea may have
merit, it remains to be seen whether it is effective as a long term
business strategy.

860. Shellp, Gulam, GFA Basic

Newsgroup: comp.sys.atari.st
Date: 1992-01-26 16:54:56 UTC
From: arktik@ersys.edmonton.ab.ca
Message-ID: <0626eB1w164w@ersys.edmonton.ab.ca>
Source record: 226306

Greetings.

I'm having problems trying to write a chunk of code to access the "shellp" features of Gulam and Mupfel.

I want to create a shell to go in my soon-to-be-released "TreeTop" BBS package (hierarchical message base system) that would let you use standard gulam or mupfel commands while adding some of my own and creating a new environment.

The problem is, I'm writing this in GFA Basic. (I know, I know, but you find me a language that is interpeted as well as compiled, has a wonderful editor like GFA, and lets you fix mistakes and problems on the fly... Besides, I'm a floppy user)

Anyways, I wrote a chunk of code similar to this:

```
Shellp=$4f6
Togu=Lpeek(Shellp)
Command$="ls -l"+chr$(0)
Return%=C:togu(Varptr(command$))
```

I tried thousands of combinations, like using "Call togu" instead of C:, passing a null string, executing the contents of "togu+2" instead of togu (which contains a "jmp" command before the address).

I'm annoyed. I really want to get the shell and configuration editor done on this thing. It's really beginning to bother me. All I ever get is two bombs, and I have to re-boot every single time because the computer doesn't stay operational for long after this crash.

I tried linking in some C code in .O files, but am doing something wrong as well. I even tried putting a "system.ttp" program on the same drive as the bbs and trying to load that with "pexec mode 3"... which bombs, as well.

Help me!

In a previous article, Roger.Sheppard@actrix.gen.nz (Roger Sheppard) says:

>> I've got a Supra ST DMA->SCSI Interface that's about a year old (It's
>> got the clock on it) and I'm having some <gasp> troubles.
>>
>You only terminate the last drive in the chain, if not the Supra host adapter
>can't drive all that load..
>
>What addresses have you set your drives for..??
>
>On another note can you tell me the part No. of your clock chip in
>the Supra host adapter, this is the big ic.. 24 pins..

If I only terminate the last drive in the chain, it's the only one that
works. The supra documentation reccomends terminating the drive closest
to the interface. If I terminate the drive closest to the interface,
erratic performance results (ie, now it's here-now it's not drives.)

The drives are set for SCSI 0, LUN 0 & SCSI 1, LUN 0.

The part # on the clock chip is: DS1287 (and yes, I know what the big
Dallas chip is :) I'm not hardware-illiterate (sp), that's why this
puzzles me so much...

Those 6 chips underneath your power supply are, indeed, your TOS chips.
My recommendation to you is to call CodeHead Software at (213) 386-5735
and order the new TOS 2.06. It fixes a few bugs that were in TOS 1.04
(aka TOS 1.4), and gives you some additional goodies. It costs approx.
$139 US, but call them for exact prices. I am waiting for my TOS 2.06 in
the mail for the time being.

866. Re: Anti-flamewar proposal.

Newsgroup: comp.sys.atari.st
Date: 1992-01-27 01:13:59 UTC
From: Jeff McWilliams <JJMCWILL@MTUS5.BITNET>
Message-ID: <92026.201359JJMCWILL@MTUS5.BITNET>
Source record: 226319

Well, I thought I would add something from the Atari 8 bit side to this
thread, as it seems the MOST INTELLIGENT thing I've read regarding
the Amiga Versus the Atari ST/STE/TT yet.

What I hate about the Atari 8 bit .....

Lack of a good ANSI C compiler. There are a few PD c compilers for it, and
only one commercial C compiler that wasn't a heck of a lot better.
There was a decent Pascal Compiler, but it has a serious bug in it
that hinders code of larger than about 8K in size.

Slow processor speed. Even the Apple II has processor speed upgrades.
Half the problem is the Antic chip, which is responsible for the
screen display, just isn't designed to run any faster than 1.8mHz.
Since some higher resolution needs to be implemented on the 8 bit
the ANTIC could be shut off and a faster machine could be realized.
Heck, the Lynx uses the same processor as the Atari 8 bit basically,
only it runs at about 8 mHz...

Like I said, better graphics. I don't need something awesome like
1280x960, 640x480 would be great , even in monochrome mode.

That's all I don't really like , now for what I like.

Longevity - this computer has been my baby for about eight years now,
and it is still meeting most of my BASIC computing needs even with
computers like the TT and the 486 40's selling today.

Simplicity - the operating system is easy to program and understand.
The processor isn't so complex as to make your head spin.

Upgradeability - even with the "old technology" that it has,
I can take advantage of Hard Drives, IBM keyboards, and 1.44meg floppy
drives.

Sure my computer is no longer on the cutting edge technology wise,
but I am not afraid of it either. It doesn't bother me to pry off
the cover and look inside, seeing what really makes it tick. I am not
afraid of designing a circuit to do this or that.. it's fairly simple
and straight forward. The 8 bit community is a friendly one, and
being part of it gives me a warm sense of family.
I don't feel like just "another PC clone owner" among an ocean
of clone owners.

I'm..back! Lets see now...more personalized comments..from yours truly:

You must be joking?! End of January!? Spectre 3.1? Please don't smoke
that stuff while online guy, you could injure yourself...

If you read David Small's message he left on the net Spectre development
is at a STAND STILL, and has been for quite sometime, almost a year I think.

Dave has been too busy programming his utilities for his SST board, and
trying to get the thing out...

They now are working on a MEGA STE version, which is going to delay things
even more.

I also suspect that MAC emulation has gone about as far as it is going to
on the ST. 68000 machines...anyway. What Dave needs is a MMU based
machine to do any more serious developement, to map out those naughty hardware

direct instructions.

I think Dave realizes this, and has decided to get the SST out so that we can achieve the next level of cheap mac emulation....

CHEAP, high quality:

High res COLOR support...
Possibly NuBUS support in the future??? (Probably not, but its fun to wonder..)
....

And, hopefully to use MORE actual Apple equipment on our machines....

I really admire, Apple's display equipment, its very nice...

I have been saving my money for a nice SST machine.

-Greg

869. Re: VORTEX ATonce 386SX for MSTE's

Newsgroup: comp.sys.atari.st
Date: 1992-01-27 03:06:30 UTC
From: Jeff McWilliams <JJMCWILL@MTUS5.BITNET>

Source record: 226322
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Yes, the 386SX is basically a 386 32bit CPU in a 16 bit package. It will run all 386 stuff, just slower because of the data bus. The IBM people say it's a crippled CPU, I guess in a way it is. With costs constantly coming down on the 386 now that the 486 is out and "THE THING" I don't know if it's even justifiable to get a 386SX anymore. Of course for someone NORMAL it would still be plenty of horsepower ... unless you want to run windows.

Just my opinions.......

A quick post...I placed an order with Codehead for TEC when they first announced the board. I then promptly lost their phone number. Two questions:

1. Does anybody know whether they are shipping yet? Or when, if not?

2. What's their number?

Thanks..

.Philip

871. Re: Sozobug 1.33i

Newsgroup: comp.sys.atari.st
Date: 1992-01-27 04:01:47 UTC
From: n160ao@tamuts.tamu.edu
Message-ID: <8127@tamsun.tamu.edu>
Source record: 226315

I was not able to get Sozobon 1.33i "Heat and Serve" to install on my 1040ST with TOS 1.0 and 2.5MG. When I get part way through the installation the "-" minus signs turn into a series of random looking characters then I get two bombs. After the two bombs, a error message from the Heat and Serve installtion program says that the "CC.PRG" program cannot be found.

Here is what I did to attempt to fix the problem:

1) Downloaded the UUENCODED files again
2) UUDECODED the files again
3) ran the zoo 2.1 integrity check (it passed)
4) un-arced the zoo file again
5) tries the install program again (not luck)
6) checked my disk for problems
7) re-fromated my 60Mg hard disk and mapped out 6 bad sectors
8) did steps 1-6 again and got the same error

Here is what I need to know?

Is the "Heat and Serve" intended to work only with a certain level of TOS? Has anyone installed it succesfully on a 1040ST with TOS 1.0 and 2.5MG or less of memory? If so, will you send the SOZO133I.ZOO file to the atari archive?

Thanks a bunch (especially to Steve Yellington, who always seems to have useful comments about everything)

Has anyone tried the PCDitto software emulator on a TT? If so, does it work or no? If it does work, I wonder if the speed would be good enough to make it actually useful, unlike its speed on a regular ST.

Let me know if you know....

Thanks,

--Bill

873. Re: codehead TEC query

Newsgroup: comp.sys.atari.st
Date: 1992-01-27 05:39:38 UTC

In article <1992Jan27.034154.13970@acsu.buffalo.edu> ugafence@ubvmsb.cc.buffalo.edu (UB FENCING CLUB) writes:

> {A Query regarding the status of the CodeHeads' TEC board}

When I called them early last week they said that the thing holding back shipment of the TEC was a lack of TOS ROMs - evidently, Atari found a "last minute" bug in 2.06 and has decided to go with 2.07, which will presumably correct that bug. The person I spoke to over the phone said something like 1-2 weeks from last Monday, but, then again, they said they had a firm Jan. 10th shipping date. (In fact, they told me I would probably get mine before that, because I just ordered the ROMs for my 520STe).
The CodeHead's number is: (213)386-5735. They seem to be pretty upset about the situation as well - I think Atari's to blame in this one, not CodeHead.

-- adam

P.S. - Just i case any of you are wondering: if you have a 520/1040/Mega ST, you need the TEC (TOS Expansion Card) to use TOS 2.0x - if you have an STe, however, you _may_ only need to bridge two jumpers and swap chips (some early STe's [those with TOS 1.60] might need to have their ROM chips desoldered). The ROMs themselves cost $60+S/H direct from CodeHead, which is probably the best price you'll find - CodeHead is selling them at cost.

I got the heat-n-serve to install on my 520STFM with 2.5 megs and TOS 1.0
I unzoo'd the file and it went to six files I believee, the install.prg,
install.doc, gemenv.prg, and three .pdf (packed) files... Then running
the install.prg as mentioned in the .doc, it set up my directories and
unpacked the stuff for me... I found that to have enough space, I told
it to unpack the docs onto one disk and everything else to another (all
this in the install program), this should work... (also I was using an
826K disk, but I'm pretty sure it would even work on a 720K one, as long
as the docs are on a separate disk). Hope this helps...

Some people made me aware of a bug in Arcgsh 4.0: If you have more than two desk accessories registered, the "ARCGSH" menu is distorted. (Usually I don't have more than two accessories so I didn't notice it.)

This bug is fixed with the new Arcgsh 4.1. I just uploaded it to atari.archive.umich.edu, and it should soon show up in the directory /atari/archivers as arcgsh41.zoo. I also sent Arcgsh 4.1 to Steven Grimm who should post it to comp.binaries.atari.st.

The best ftp sites for the atari st are (in my opinion):
sol.cs.ruu.nl
atari.archive.umich.edu
nic.funet.fi
wuarchive.wustl.edu
Of course, I hope those site names are correct, I typed them from memory...

Happy ftp'ing!

Is this the thing with characters being left on the screen.??

One thing that did not look right was one of the drop down menus has
what looks like Quick Keys, but the letters are way to far over to the right
and hard to read, you could move them over to the left a bit and give them a
right margin, this would make them far easer to read.

The way it look at the moment is that the menu is picking charaters
from another menu to the right..!!

I had a similar problem. Of course, I had multiple AUTO programs and DC
Desktop running, along with QuickST and a few other things...

My solution was to go to a bare-bones DeskTop (ie, the only AUTO programs
running were FOLDRxxx.PRG and the TOS 1.4 'fix' programs). Apparently, the
LHarc program used during the installation process does a few flips and giggles
if you're running non-compatible TSRs.

|> Stig Vidar Hovland - stigvi@lise.unit.no

That's not perfectly right. The 386SX is a 32bit processor, but unlike the
"normal" 386 is has only got a 16bit wide external bus. Internally it's got
32bit registers, just the same way as the 68000. If there's any software
which really uses these 32bit is another question...

Hi People,

I am on the verge of buying myself a new printer -- an HP Deskjet 500. It looks (to me) like a sound step-up from my Epson LX-80. I just need a smidgen of encouragement from fellow ST users before I make the final commitment.

I want to use it with TeX, GhostScript, and GEM Metafiles. Does anyone have some damn good reasons why I am going to come to grief? Or am I on to a good thing? Hopefully the latter...

Thanks `a priori' for any words of encouragement, experiences and anecdotes.

Cheers,

>trouble preserving 'hard' CR's, so why should the ST version?

Don't know about this one as it's not a problem that I have but it must be
possible - most things are with emacs.

>
>Similarly, how would I go about creating a mode (or defining the key)
>so pressing enter caused CR and LF to be inserted?

Modify the keymap either for a special "ME" mode or for the global keymap. This
is described in the manual in the chapter on customisation. This may be
possible by a fix something like the fix for C-s being hold on vtxxx terminals.
This is detailed in the PROBLEMS doc but it basically consists of replacing C-s
with C-\ and setq'ing the keyboard-translate-table. This is done in the
emacsini.el (.emacs - see below).

The following line in my .emacs defines C-x! to be the function
this-line-to-top-of screen (a function I wrote myself).
(define-key global-map "\C-x!" 'this-line-to-top-of-screen)

I may as well include the keyboard translate table stuff for C-s as well

```
;; Suggested fix for Isearch at startup problem
;; Make a keyboard-translate-table
(let ((the-table (make-string 128 0)))
;; Default is to translate each character into itself
(let ((i 0))
(while (< i 128)
(aset the-table i i)
(setq i (1+ i))))
;; swap C-s with C-\
(aset the-table ?\C-\\ ?\C-s)
(aset the-table ?\C-s ?\C-\\)
;; swap C-q with C-^
```

```
(aset the-table ?\C-^ ?\C-q)
(aset the-table ?\C-q ?\C-^)
(setq keyboard-translate-table the-table)
)
```

>
>(Bonus Question): What is the name of the .el file (and where does it
>live) that I can put startup commands into? On my Unix box here it's
>".emacs" but that obviously won't work on the ST.

This one I do know !

It's called emacsini.el and it lives in your root directory (where emacs is started from). I found this out more by luck than anything else - I think it's in one of the README's that come with it.

Hope all this helps to solve the problem - If you manage it I'd be interested in the solution.

Bye,

John

This one is new to me. All menus look fine now, at least on a monochrome
screen. Do you use a color monitor? Perhaps the symptom you describe has
something to do with the one that is corrected in Arcgsh 4.1. Please try
out the new version and let me know!

> B) I have to bring a window to the front before I can launch a program
> from it.
> C) I can't arrange my desktop in any efficient way.

Agreed. Since switching to Codehead's HotWire/MaxiFile environment I've been able to circumvent these problems.

> D) There is no effective and consistent multitasking environment.

Agreed again.

> E) Do we really need to reboot to change resolutions?

I guess I don't really care about this one. A combination of a bootable, reset-proof ramdisk and a resolution switching utility makes this almost painless (15 seconds, tops).

>II) Hardware bitches
> A) Why is TOS in ROM?

I like TOS in ROM. It's fast and I don't have to see the desktop for more than 2 seconds before HotWire takes over (I can't say enough about this shell).

> B) Our graphics modes suck.
> C) We need a bus (or buss if you are a total computer nerd)!
> D) The power supply/keyboard/mouse all suck.
> E) Non standard connectors.

Yep, yep, yep, and yep. The new machines address mostof these issues. My only real gripe here is the power supply. I just replaced mine with a Best supply. The keyboard is a little mushy, but better on the Megas than the 1040s. There are enough decent third party mice that everyone can find one that they like.

Add to this list the 4 meg RAM limit. I don't want to have to move up to a TT just to get more RAM... I don't really need the extra processor

speed and graphics modes.

Another complaint is all the RF noise the ST generates. I use my ST primarily as a MIDI tool, and my guitar pickups just scream when I get near my ST (even when I turn off the monitor). Okey, I know they want to keep costs down, but this has backfired several times when they couldn't get the new machines past the FCC.

WHAT I LIKE ABOUT MY MEGA ST.

1. The SM124 monitor. Cheap, sturdy and great to work with. It's hard to bitch about these even if they do give out after a few years... at $25 a year for a great looking monitor it's still a bargain.

2. Built-in MIDI ports. Great idea, and it created an instant market and MIDI software base. I expect to be using my ST for many more years for the MIDI capability alone, and Atari has the forsight of keeping the interface on all the new models. I don't miss the MIDI thru port... most ST MIDI software handles the problem just fine. I would still recommend an ST first to anyone interested in computer based MIDI.

3. The loyal users. A machine this good wouldn't die a graceful death despite all of Atari's...er...INTERESTING marketing strategies. I can always get quick and useful answers to my problems on USENET, GEnie and Delphi, and the public domain software base is tremendous. About half of my most used software is public domain. I also consider folks like Codehead and Double Click to be loyal users...they certainly aren't in it for the money! Publications like ST Informer and Current Notes keep me up to date with the new software and hardware, and I can't believe anyone's getting rich off of them!

4. Personality. It's fun being a non-conformist. Okey, sure I'm disappointed when new software doesn't get ported to the ST, but on the other hand think of the money I save! 8^B

5. Dave Small. I don't own any of his products, but I like reading his magazine articles and I just feel better knowing he's around.

6. The 680X0 family. I haven't done much assembly language programming on my ST, but it's nice to know that when I do I won't have to delve into an Intel processor!

7. Bob.

8. And finally...Atari. For all our bitching, there are still some enthusiastic folks busting their butts to keep the ST family alive. No company is going to make everybody happy all the time, but Atari could have easily scrapped the ST line entirely and focused on the PC clones. It's just good to know that they are developing new machines in the line.

891. TEX printer problems

Newsgroup: comp.sys.atari.st
Date: 1992-01-27 14:35:14 UTC
From: dh108@cs.city.ac.uk
Message-ID: <1992Jan27.143514.28656@city.cs>
Source record: 226252

I have successfully set up CS-TEX to allow me to run a basic TeX and
LaTeX setup on a 1 Meg 1040 STE, with 2 floppy drives (one can be
used if your prepared to swop disks alot), which allows me to
edit, process, view and print documents. I takes just 4 disks.
One for the TeX bins, one for the fonts and inputs, plus one each
for the viewer and printer driver.
(If your wishing to set up a similar system, mail me and I'll
tell you what you'll need, if there's enough interest, I'll put
together an article explaining things)

My problem lies in the 24-pin printer driver. I have a b/w Star LC24-200
and I use the Epson option in the driver, as suggested in the Star manual.
Occasionally (randomly) in the output, lines get skewed. Does anyone else
have this annoying problem? Is it due to the Epson emulation? Can I get a
true Star driver, or is the problem simply due to the resolution of the
output? (I highly doubt this, but thought I'd mention it.)

Thanks in advance for your help.

Mark.

Steve> If you have two SF314 drives, put ZOO.TTP and the FILE.ZOO file on A:,
Steve> switch to B:, and run A:ZOO x A:FILE.ZOO. This is fairly simple and
Steve> straightforward if you're using a command-line shell. It's also
Steve> fairly simple with any of the several GEM-based shells that work with
Steve> ZOO.
|
Steve> It's a little harder with the standard GEM Desktop.

Not really, I believe that the following must be some undocumented
feature since I have never seen it in *any* ST Owners Manual. Even
the Double Click people musn't know about this since they sometimes
overload the right mouse button. The following works in good ol' TOS
1.0 and 1.2 (disclaimer: at least the versions that *I* had!). To do
Steve's recommendation above from the DESKTOP, just make B: be the
top-most GEM window. Make sure that ZOO.TTP is visible in window A:.
All set then, double click on ZOO.TTP while simultaneously holding the
right mouse button *down*. It's that easy!

Steve> Note that to run ZOO from the Desktop, you MUST have TOS 1.4 or newer.
Steve> Previous versions will not pass the .TTP arguments correctly.

True for the `extended' commands of ZOO. But the `novice' commands
will always work.

> installation the "-" minus signs turn into a series of random looking
> characters then I get two bombs. After the two bombs, a error message
> from the Heat and Serve installtion program says that the "CC.PRG" program
> cannot be found.

I don't know what's causing that problem. The .PDF files are self-extracting
LZH archives. The "-" sign is a progress indicator that is supposed to turn
into "*" as the archive is melted. All INSTALL.PRG does is load the .PDF
files, change to the appropriate drive, create the directories, and execute
the .PDF program.

I'll run some tests on this as soon as I get a power supply for my TOS 1.0
machine, but I note that Ben Gilbert installed it on his (on floppies)
without trouble, so I have to wonder if there might be something in your
machine that's stepping on memory -- a bad chip, a wild desk accessory,
etc.

Meanwhile, you can install everything manually by creating the directories
and then running LHARC (any recent Questor version) to unpack the .PDF
files. You then should run INSTALL again, skipping the steps that unpack
the .PDF files, so that it can install GEMENV.PRG and update your DESKTOP.INF
file for you.

In article <10298@cactus.org> covert@cactus.org (Richard Covert) writes:
>Actually the last ST Report had the supra ad. and Supra is offering
>the new modems at a special price to BBS operators. A really good
>deal.

Two days ago (on 25 Jan) I ordered a modem from a company
called "B.F.J." (1-800-932-4712) who are selling the SupraFaxMOdem
v.32bis for US$279, including shipping (presumably only to the
US/Canada, but you might ask). When I called they had a back order
of around 60 modems, but you might be able to queeze in on the first
shipment from Supra if you call soon.
If you're not interested in the "bis" option (hint: you ARE
:-), Computability is selling the FaxMOdem v.32 (no bis) for $239,
and their number is 1-800-558-0003. They are selling the v.32bis
modem for $309.

>
>Did you also notice that the new modems are also send and receive
>faxc modems? And that Supra has Fax sw only for the IBM PC and
>the macs? so, both STers and amiga users can use the modem only
>as data modems, not as FAX modems.

There are actually three versions of the software that
they're shipping - Mac, PC, and Windows. All three of these are
commercial, "off-the-shelf" packages tat Supra has merely licensed
for use with their modems. I don't think that they would go through
that kind of trouble given the small size of the ST market (there is
at least one commercial fax package for the Amiga - but maybe Supra
didn't want to bother, agai because of a miniscule market).

>seems kinda strange that Supra isn't releasing ST FAX sw to
>use with their fax modem!!

Aha! I sense an opportunity for a smart shareware author to
make some money! (heh! - evil grin!) If/when I receive my Supra
modem, I might try to whip up something - but you might also try
talking to the CodeHeads, who were considering importing a French
send/receive fax software package - with the plethora of v.32/fax
modems (thanks to the new Rockwell chipset), maybe there will be a
market for such software for the ST!

898. How to hook a Microsoft bus mouse to the ST

Newsgroup: comp.sys.atari.st
Date: 1992-01-27 17:36:18 UTC
From: boyd@sigma.cs.fsu.edu
Message-ID: <1992Jan27.123618.17885@mailer.cc.fsu.edu>
Source record: 226262

Back by popular demand, here is the article which describes this:

----cut here---

Date: 21 Feb 89 03:02:45 GMT
From: tektronix!ozvax!tekcsc!jeff@ucbvax.Berkeley.EDU (Jeff Beadles)
Subject: Here's how to hook a MicroSoft Mouse to a ST
To: info-atari16@score.stanford.edu

Well, here is how to connect a Microsoft Mouse to an Atari ST. (520/1040)
The Atari has a 9-pin D-type connector. The Microsoft Mouse has a rather
strange connector on the end. To prevent having to cut the mouse cable up,
I made this adaptor. If you still can't follow it, please let me know and
I'll try to redescribe it. This does work for me. I've been using it for
6 or so months now with no problems at all. It does take some soldering
skills, so if you're not so hot at soldering, find a friend to help.

As far as I know, this does not effect your Atari's warranty. However, I
have not asked Atari. :-)

Atari ST Microsoft Mouse ST expected signal
----- -- --------- ----- -- -------- ------
1 5 XB
2 3 XA
3 8 YA
4 9 YB
5 N/C N/C
6 2 Left button
7 N/C +5VDC (N/C)
8* 6 and also tie to pin 1 Ground
9 7 Right button

* = I am not sure why I have pins 6 & 1 tied together, but it does work.

The Microsoft mouse connector looks like this. This is the solder side,
with the leads pointing up.

```
---------------
| 1 |
| 2 3 4 5 |
| 6 7 8 9 10 |
| |
---------------
```

If you can not use the connector, the pins are numbered as follows. This
is the connector side from the Microsoft Mouse plug:

```
/------------\ This is a view at the front of the connector.
/ Blank "KEY" \ It is where the plug from the mouse would be.
/----------------\ The pin labeled 'n' is not connected.
| n 4 X 8 | The place labeled 'X' is filled, and does not
| 9 7 1 2 | have a pin.
| 5 6 |
\ /
\------------/
```

Have fun!

Jeff

You have to be joking guy, don't even try to compare AMIGA DOS with ANY
version of UNIX, especially the Mach version on the NeXT.

Its not even in the same league.

AMIGA DOS is incredibly primitive compared to Mach. Let me See the AMIGA
3000-25 run the same OS on its architecture, as the Next 030, and I bet
you wouldn't be such a proud owner of your 3000.

900. unnkullian adventure questions

Newsgroup: comp.sys.atari.st
Date: 1992-01-27 18:07:38 UTC
From: meulenbr@ce.philips.nl
Message-ID: <1992Jan27.180738.2744@philce.ce.philips.nl>
Source record: 226340
Cross-posted to: rec.games.misc,comp.sys.atari.st

Hi,

I've started playing unnkullian adventure on my ST last weekend.
Getting started was pretty simple, but now it seems that I'm stuck.
I have 67 points (out of 400).
I think I've been on all places before the guardian, and on most places
I could do something. I also obtained a lot of stuff.

On the next screen are some questions. They may contain spoilers, so if
you are not that far in the game you may probably not want to read
further!

Main problem is how to pass the guardian. Probably I do not have all the
stuff (or it needs a trick I haven't mastered). I think I've been to all
places and retrieved everything.
I've also some smaller potential problems:
- I cannot operate the machine yet. I suspect I do not have the needed
resources.
- I've done nothing at the lake view room
- I could not descend the cliff by going west. A fatal fall is the result
- I haven't done anything with the patrons in the cliff.
- I cannot pass beyond the inn. I suppose this is impossible.
- I cannot post the card. If I drop it in the birds nest nothing
happens. And I want to try to catch that bird :-)
- I could not retrieve the rasberries.

I don't think there are other potential puzzles before the guardian
which I haven't mastered. If anyone has a hint, please let me know.
I do not have a need for spoilers yet.

Thanks,
--

>and 512k for your editor.

Revolver is quite nice program, but there is some problems.
First of all it is a switcher so the program in the background does
not run. Sometimes it is good as it does not use cpu either, so
program in the foreground runs as quickly as possible.

The other problem is that revolver does not work with
a graphics card. It was a nice idea from Atari that you can
change the position of display memory, but with a high resolution
card it does not work.

>just exactly what it does... (I dont see a difference between
>when I turn it off, try things, and turn it on again... btw: if
>it makes any difference, I am using a mono monitor)

Rats, you don't have a color monitor. Well, if you ever get a chance to hook up the STE to a TV (color preferably :^) , get a copy of the Bird demo. I'm pretty sure it's at atari.archive; it's very old too, but does a good job at showing what the blitter can do. Run it with the blitter on and run it with the blitter off. The demo shows a bird flying across the screen with a seascape background.

On a monochrome monitor, if you have a copy of a paint program which will show a block of the screen when you move it around to paste it, you can use that (with blitter on and off) to see what affect the blitter has.

For most uses however, QuickST, TurboST, or NVDI are best. If you're doing a lot of graphics and/or animation work, the blitter will be useful to you.

Gcc/g++ are the ideal choice if you have the memory.

>Do any MiNT users use TeX and LaTeX? If so, what version of TeX do
>you use under MiNT?

Christoph Strunk's CS-TeX package is "MiNT-aware", i.e. the dvi drivers etc
can run in the background. I assume that the other ST TeX packages would also
work with MiNT installed, but you'd probably lose the multitasking.

I don't really know what exactly CS does in his TeX but if it's really very
important I'll ask him :-)

909. Re: Anti-flamewar proposal.

Newsgroup: comp.sys.atari.st
Date: 1992-01-28 00:01:49 UTC
From: Azog-Thoth@cup.portal.com
Message-ID: <53521@cup.portal.com>
Source record: 226349

Most of my ST gripes are the same as the article that started this thread, but...

I agree launching a program from the desktop is slow, but since Ive ordered and am waiting for TOS 2.06, I hope this will remedy that problem. I currently have NeoDesk 3.2 and love it, but am wondering if Ill need it for 2.06? Ill find out...

I dont mind not having a buss, considering all the ports that are available. One this I miss is the absense of an accepted industry standard hard drive interface (ST-506 at least, or true SCSI).

I dont like the processor speed. I think Atari is still the only company these days that has a current product with an 8MHz 68k. And memory expansion isnt that bad. Ive an STe with 4mb (not a Mega STe, tho. 4180STe? In keeping with the model numbers?) but I want more, more, more RAM!

I like the OS in ROM. Its not a hassle to boot of a disk. Since at this point I dont have a hard drive, thats fine with me. Also, I disagree with the original posters comment about upgradeability. TOS 2.06 only cost me $63, which is less than say MS-DOS 5, or DR-DOS 6. And upgrading is easy (at least for me, since I am a qualified electronics technicion and bad speller, I dont mind ripping my machine apart)

If TOS 2.06 will fit right in my late 1991 STe, I anticipate a 15 minute procedure. Try to upgrade MS-DOS in that time. Hell, loading MS-Windows takes a hell of a lot longer than that to load. Considering that a GUI is part of the Atari OS, thats not bad...

I hate my non-Mega keyboard. The layout is perfect, the feel sux. I see a product called Z-Keys that will allow you to attach a PC clone stanard keyboard, which will allow concurrent use of the ST and PC keyboard. Maybe... Anyone have this?

Screen resolution is no big deal to me. Monochrome is close enough to standard VGA, which is fine with me. I wouldnt mind having 1280x1024, or 24 bit colour, but those upgrades would undoubtable cost over $1000

Now, let me justifiy myself a little. All these do not add up to a flame against Atari. I work on very large VAX machines, Macs, IBM mainframes, PCs, etc... Ive no loyalty to one or the other. I like my Atari cause it does most of what I need...

And if I could afford it, I would love a TT. I also am wondering about the ST Book. Anyone have one, or have any stats on it? Like memory, disk storage, price?

>You have to be joking guy, don't even try to compare AMIGA DOS with ANY
>version of UNIX, especially the Mach version on the NeXT.
>
>Its not even in the same league.

Dream on, you don't know what you're talking about. If AmigaDOS (actually exec.library) had memory protection and virtual memory, it would virtually be unix. Exec, like Mach, is not Unix, they are merely microkernels with other OSs put on top, (in the Amiga's case, dos and intuition, in the NeXT's case, BSD and NeXTStep).
If they are not in the same league, how come I can compile most Unix source's without changing anything? How a number of Exec and Dos functions have the same name as Unix counter parts?
Exec is even object oriented!

>AMIGA DOS is incredibly primitive compared to Mach. Let me See the AMIGA

Well it lacks memory protection and virtual memory, but besides that, Mach doesn't have that much on it. Exec has the fastest context switch time of any multitasking OS, and its the reason why we don't have virtual memory or memory protection. The entire Amiga OS relies on shared memory the tasks can write to each other's local memory. For instance, when you send a message, it doesn't copy it, it just changes a single longword pointer to point to the message.

>3000-25 run the same OS on its architecture, as the Next 030, and I bet
>you wouldn't be such a proud owner of your 3000.

Get a clue. The 3000 has a very fast memory and bus design. The Zorro III bus can reach speeds of over 40mb/s at 25mhz, and the 3000 uses burst/nibble SCRAM ZIPs, 32bit access to memory, and a custom chip, RAMsey, to manage RAM access so it knows when to use the SCRAM features.
The NeXT is slow because Display Postscript is slow. I should know because I have an AMI 486/33, Tseng ET4000, running ESIX SVr4 with Motif, OpenLook, OpenWindows, and NeWS (Display Postscript). When I run NeWS it takes about 5 seconds to move a window, about 8 to resize it, and the whole time the mouse pointer jumps around the screen because the server is running in 100% interpreted postscript. If it's slow on a 486/33 w/16mb memory, 256k cache, imagine how slow it is on a 256 byte cache, 68030/25 with 8mb of memory.

What this has to do with the pathetic ST I don't know.

>-Greg

911. STalker 3 problems!

Newsgroup: comp.sys.atari.st
Date: 1992-01-28 02:04:52 UTC
From: jhp@sactoh0.sac.ca.us
Message-ID: <1992Jan28.020452.22012@sactoh0.sac.ca.us>
Source record: 226254

Has anyone had any problems booting up their system when STalker 3 is installed? I installed STalker on my hard drive and when I tried to boot up with, my machine would lock up. It locks up when loading the NEODESK.EXE program.

On the rare occasion that I am able to get my machine to come up, I select STalker from the DA panel and nothing happens. The mouse moves around but STalker doesn't show and I can't do anything on the desk top. Does anyone or has anyone had this problem? If so, could you let me know how you rectified the problem. BTW, below are the programs in my auto folder and the DAs I have on boot up.

Auto folder - TOS14FIX.PRG (They are in this order)
POOLFIX3.PRG
DCACHE.PRG
ICDTIME.PRG
NEOLOAD.PRG
GDOS.PRG
AUXINT.PRG

DAs - Diamond Format
NeoDesk CLI
DC Xtract Plus
Harlekin

Thanks in advance.

912. Supra 20-Meg HD for sale!

Newsgroup: comp.sys.atari.st
Date: 1992-01-28 02:49:07 UTC
From: aa399@cleveland.Freenet.Edu
Message-ID: <1992Jan28.024907.3147@usenet.ins.cwru.edu>
Source record: 226350

I have a Super 20-Meg HD for sale.

A new host adaptor was recently placed in it.

The system comes with the original box, cables, manuals, and software.

There is one slight problem with the mechinisim. It sometimes "sticks"
and the switcher inside of it needs to be moved in order to work.

I have been told by more than one person that this is a common problem
among Supras and that it can be easily fixed by a good cleaning.

If you have had this problem before and know how to fix it, you might
want to take a chance on this one.

OR

You can just keep using the drive even though it sticks sometimes.
When left on, there is no problem.

OR

You can just replace it. Mechinisms are cheap.

I'm interested in selling the host adaptor, casing, and everyting else.

The price: $220.00

I may go a little lower.

I originally had a buyer for this amount but it fell through.

Len

Please respond by e-mail.

P.S. for your information, the host adaptor cost me around $150.00.
The hard drive itself cost me $250.00 a year ago.

>> Is TeX Usable on a 1 meg ST w/ hard drive?
>I believe version 3.1 is not but 2.9 is.

3.1 is usable, just. I had room for FATSPEED and FOLDR080, and that was
pushing it. Of course, my copy has initex and virtex in separate executables;
newer versions merged them, and that might not fit.

>stuff (or it needs a trick I haven't mastered).

I'm sure you have everything you need to get past the guardian,
although you'll need to find an item to replace the one you'll use
getting past it. Pay close attention to what motivates the guardian,
and check your inventory to see if you've got anything that might help
out (you do).

Once you get past the guardian, more things will be clear.

Source record: 226255
Cross-posted to: sci.lang.japan,comp.sys.atari.st

I don't know if anyone remembers, but I asked about getting KanjiTalk to work on an Atari ST with Spectre a few months ago, and got a couple of replies, but I didn't have time to follow up on it. Well, I am trying again, and have found that it crashes when trying to run the KanjiTalk init (the one that has an icon with a mountain). If I remove that from the system folder, it boots up fine, but won't show any kanji. I am using KanjiTalk 6.0.7. Anyone have any ideas on getting it to work?

Thanks,

Dan

And thank god for that. I wouldn't WANT half the garbage that's in Unix in AmigaDos. Unix is good for what it does (i.e. a multi-user environment that goes to great pains to insure that another user cannot interfere with another user.), however, i prefer speed and headache free operation.

By the way, Unix or Mach are not *that* much more "advanced" if that's what you wish to call it. It's just more features (which may or may not be wanted). by your reasoning then, Multics is a FAR more advanced OS than Unix (simply because it has more features). There's more to an OS than how many MAN pages it takes up.

A few posts earlier, someone wrote about a great PD art program on atari.
archive.umich.edu...

I ftp'ed it (crackart.lzh approx. 250k) and unlzh'ed it!

Got it running...

All I can tell you is WOW! Every ST user must try it once! Seems to support
ST/TT users! Load Degas, Crack Art, Neo, Spectrum, IFF, ... (?!).

Tons of great features BUT the docs are in German (yet the prg itself is English...) The
crackart.txt is 120k long...

Anybody know of a English version? of the text file????

If the programmers read this please respond (apologies: don't have the info
in front of me (names, etc))...

(Better than Degas!!!)

930. gnuemacs and ispell

Newsgroup: comp.sys.atari.st
Date: 1992-01-28 14:07:55 UTC
From: hofmann@cbnewse.cb.att.com
Message-ID: <1992Jan28.140755.29512@cbnewse.cb.att.com>
Source record: 226267
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I am using gnuemacs 18.57 and Bammi's ispell port (both are
excellent ports, many thanks to Scott and Jwahar). Howerver,
I am unable to invoke ispell from gnuemacs using the ispell.el
in the ispell package. That does not surprise me, as I would
expect to have to set an environment variable or a path in the .el
file. However, after playing around with it for awhile, I could not
get it to work. Does anyone on the net use ispell from gnuemacs (18.57)?
If so, would you let me know what I have to set up in order to do it?

On a related note, Edgar Roeder(sp?) posted a compile.el and then
a patch to it to create a compiles.el. My version of patch will not h
handle this file. Would some kind soul email me an updated compiles.el?

Thanks in advance!

Why not get TOS 1.4 then you would have lots more room, it uses these RAM
than TOS 1.2 , plus you don't nead Fatspeed and you can do away with
Folder Fix, and you would end up liking your machine more..:-)..

>output? (I highly doubt this, but thought I'd mention it.)

The problem is known: This is not due to the high resolution or the Epson
driver, it's a bug in the Star firmware.

Christoph Strunk, the author of the CS-TeX package, knows about this. I don't
quite remember what the fix was but it will be mentioned in the forthcoming
new version of CS-TeX. I will post here the moment the new version is out.

Also, I will ask Christoph what exactly the bug is about. I will post this
information here as well.

933. Re: Deskjet 500

Newsgroup: comp.sys.atari.st
Date: 1992-01-28 14:38:19 UTC
From: rgoseweh@digi.lonestar.org
Message-ID: <1992Jan28.143819.20133@digi.lonestar.org>
Source record: 226278

I have an HP DeskJet 500 (upgraded from the original DeskJet) and I love it! It is quiet, reasonably fast, and has beautiful output. The output compares favorably to my HP LaserJet III at work. (You have to look real, real close to see the difference.) I don't use Tex or Ghostscript but do use GDOS (actually G+PLUS), primarily with Easy-Draw (GEM Metafiles) and Word-Up.

Be aware of a couple of things: 1) The printout *is sensitive* to the paper stock that you use. Some paper will give really crummy printouts and on others you could swear you had a laser printer. 2) With GDOS fonts, the driver is very important. For most of my GDOS programs I use the Migraph driver with excellent results. However, the Word-Up fonts print better with the original Neocept TurboJet driver.

I have never regretted buying this (or the original) printer. I have recommended it to many friends and not one has been unhappy with it. Go for it!

Hello, I seem to be having trouble using manx's Aztec shell v3.6a
under spectre (v3.0). Whenever I try to launch the shell spectre bombs
and returns "bus error"... this bomb is not recoverable (I can only restart
the finder).
I use this shell alot at work as a platform for the aztec C68k (MPW)
compiler. It works on all the machines at work (plusses,se's,II's) and I was
really suprised to find it crashing with spectre.

any help or insight would be appreciated. thanx.

Neither of you guys must stray far beyond the comp.sys.* groups,
I guess. Like say to news.announce.newusers, for a start . There are
a few monthly postings there that provide some basic guidelines on
how to interact with the usenet community.
Now, one of the conventions generally followed is that dropping
"flame bait" into newsfroups whose charters don't encourage such behaviour
is childish, and reflects what is commonly considered a "BBS" mentality.
This cyclical dropping in by some amiga user to start a flame war
has caused anyone who knows how to use theis newsreader to kill all
postings that mention the word amiga. Strangely, enough, Amiga users
tell me this same phenomenon does not occur in the amiga groups. A
few users make the whole community look bad.

>the atari archive?
>

I installed it on my 520STFM with TOS 1.0, 2 floppies & 1 Meg memory. The installation procedure really went very smoothly & I did not have any problem. However, one thing I noticed was that the example programs after compilation & run occassionally freezes the machine. The mouse works ok, but none of the menus or buttons (in the example program that showes the GEM capability) can be activated. Could be that this program (& MINCOLOR as well) is having a compatibilty problem with my AUTO programs or DAs. I have to check on that.

The GEMENV.PRG that came with this package is quite large & took comparatively large amount of memory. I substituted this with ENVIRON.PRG (from the showdvi package). The latter is much smaller in size & saved me about 30k of memory, when checked with FREERAM DA.

940. Re: UNIXMODE

Newsgroup: comp.sys.atari.st
Date: 1992-01-28 18:01:36 UTC
From: thomas@feanor.cadlab.de
Message-ID: <1992Jan28.180136.22364@uni-paderborn.de>
Source record: 226281

First of all thank you for the quick respond to my request on my problems concerning UNIXMODE and MiNT.

Secondly I have some questions on the Minix file-system:
- Is it true that the filename-length is restricted to 14 chars?
- Is the contens of mfs0541.zoo from aa suitable to the effort of creating a Minix-like file-system and
- if it is suitable, do I need any additional sources for this purpose?

The most interesting thing for me to hear certainly was the information that someone is working on an AUTO folder program as a realization of the UNIXMODE. I'd like to know more about that...

Finally, if I try to write an appropriate file-system on my own, would it be sensible to use the file `tosfs.c' from the MINIX sources as an idea and basement to extract and modify in order to supply an alternative, UNIXMODE-able file system?

Thomas Franken

941. Re: Anti-flamewar proposal.

Newsgroup: comp.sys.atari.st
Date: 1992-01-28 18:10:57 UTC
From: mc4c+@andrew.cmu.edu
Message-ID: <0dVNml600iV1I3ep8C@andrew.cmu.edu>
Source record: 226283

I have to agree with all the ST gripes so far. Here are a few suggestions.

1) Atari has to out the idea that buss architectures make a computer more expensive where it belongs, in the garbage. The added expense to hack something to expand a non-expandable" machine is at least triple. Look at the difference between internal and externa PC harware, for instance.

2) I do not mind TOS in ROM (Well, I guess I mind TOS no matter where it is!) But it is a bit intimidating to upgrade to those out there who are techno phobes, or expensive tohave a dealer do. So here are two suggestions.
a) put the TOS chips under a removable cover on a removale card. Then upgrading is just a matter of slipping in a card. A piece of circuitboar of this lack of complexity would only add at most a few buck to the cost, and make the whole project more pallatable for many. Also, it would alow a user to ugrade TOS without voiding their warranty (Is Atari the only company left with a lame ass "The users are too stupid to be allowed to open their computer" policy?).

b) make TOS modular, So that to upgrade only bits and pieces, a disk with patches could be used as a boot disk as well as the ROM, and then the OS could be ugraded on disk until the user buys the ROMS, sorta the way the macOS is (sorta). Imagine how much easier somethig like neodesk would be to program. Or replacement VDI driver, QuickST, etc..

3) Kill the Tramiels (sorry, I couldn't resist :))

4) Make the cartidge port read/write, with a much bigger data bus. Have a software switch for compatibility.

5) Just use a better Power Supply. This is just plain bad engineering, especially when there is no bus, causing expansion hacks to have to draw inordinate amounts of power, or have ungainly external supplies.

6) Get the damn 24-bit VDI ot the damn door. What time is it? 1992?

7) include the new PDS in the notebook on all ST/TTs

All this should have been done ages ago, so I doubt it will be done now, but it is nice to dream

mark

I don't think the Spectre GCR warrants a complete seperate group...yet.

Right now, if your at all serious about the Spectre GCR your on the MAC group in rn, not in comp.sys.atari.st.

However, if Mr. Small delivers on his promise of a well designed hardware accelerator board for current ST owners, the capabilities of such a board might warrant a comp.sys.atari.sst group.

I hope Mr. Small gets the MEGA STE version out quickly, I have my check waiting...

I totally agree with Jimbo here..of course I have radical ideas about information and people but...

Any inherent restriction, placed on a group on the rn reader on the internet is extremely DANGEROUS in my view. That includes any restrictions based on content.

You post where you want, how much you want, and when you want, AND EVERYONE should recieve a copy of WHAT YOU WANT TO POST.

Actually, I welcome any alternate computer people to comp.sys.atari.st.

I think ATARI people just can't stand to hear there are many computers out there, far more capable, far less expensive, than the ones with the ATARI label on thier desks...or floor.

This group is NOT meant to be a strict PLATFORM for ATARI products. If ATARI wants a strict platform, let them set one up themselves...privately as a business adventure. Better yet if you want one write to them and send them a check...

Moderating a newsgroup through voting for a moderator would be an acceptable alternative also...

946. Did anyone write a good read() for Mint (or TOS)?

Newsgroup: comp.sys.atari.st
Date: 1992-01-28 21:02:22 UTC
From: muts@fysap.fys.ruu.nl
Message-ID: <MUTS.92Jan28220220@fysaq.fys.ruu.nl>
Source record: 226292

Hello,

for some applications I would very much like to be able to have a
read() (or an Fread() implemented in the kernel even better) that
generates vt52 escape sequences from Funcion/cursor/etc keys, so the
ST can be a real vt52.

Also, I would like that ALT-combinations do not return '0', but the
ascii code, with the 8th bit set. This would make porting of unix
editors/shells with full keyboard use much easier. (I hate to resort
to GEM and do not even start it up at a reboot).

If someone has made it I would like to use it. Otherwise, and when/if
I find the time, I'll have to do it myself.

Regards,

>>
> Dream on, you don't know what you're talking about. If AmigaDOS (
>actually exec.library) had memory protection and virtual memory, it
>would virtually be unix. Exec, like Mach, is not Unix, they are merely

Yes AMIGA DOS would virtually be UNIX, but it DOESN'T have these options,
and they aren't available period unless you buy a UNIX BOX or Package from
CBM. Which was my original point.

...
>If they are not in the same league, how come I can compile most
>Unix source's without changing anything? How a number of Exec and

Depends WHAT KIND of UNIX applications your talking about. I have UNIX
libraries too on my ST, with LOWLY TOS. But I can't compile rn and have
it run under TOS.

The fact is, you can't make claims about AMIGA DOS when it comes to running
UNIX applications of some weight like X-Windows under AMIGA DOS. You can't.
You need a fundamentally different software architecture to take advantage
of UNIX. Thats why people buy UNIX to run UNIX applications.

This is the point I was making.

>Dos functions have the same name as Unix counter parts?
>Exec is even object oriented!
>
>
> Well it lacks memory protection and virtual memory, but besides that,
>Mach doesn't have that much on it. Exec has the fastest context switch time
>of any multitasking OS, and its the reason why we don't have virtual

ANY Multitasking OS? Oh really now. Thats just a bit presumptuous...
and besides that you left out a critical point...depending on what CPU you
run a particular core program on, it could be slower or faster.

There is NOW WAY you can support that claim given the incredibly huge
variety of computers and software combinations out there.

>...
> Get a clue. The 3000 has a very fast memory and bus design. The Zorro III

>bus can reach speeds of over 40mb/s at 25mhz, and the 3000 uses
>burst/nibble SCRAM ZIPs, 32bit access to memory, and a custom chip, RAMsey,
>to manage RAM access so it knows when to use the SCRAM features.
>The NeXT is slow because Display Postscript is slow. I should know because

I don't doubt the AMIGA has an efficient bus design, its come a long way since
the A2000 days.

But here your comparing hardware to software, your bus to Postscript. The
NuBUS backplane on the next is quite fast, very fast. And not only that,
it doesn't have the double memory architecture the ZORRO III bus has to
negotiate between slow and fast RAM. The NeXT simply blows information
were it wills accross the bus. I know the handshaking for cards and
protocol is much simpler on the NeXT machine.

I don't know the exact specs for the NeXT backplane, but I bet they are
truly awesome indeed.

>I have an AMI 486/33, Tseng ET4000, running ESIX SVr4 with
>Motif, OpenLook, OpenWindows, and NeWS (Display Postscript). When I run
>NeWS it takes about 5 seconds to move a window, about 8 to resize it,

>cache, 68030/25 with 8mb of memory.
>
> What this has to do with the pathetic ST I don't know.

I didn't post it as a ST rebuke, you simply made points that I feel were
very misleading about AMIGA DOS and the NeXT system capabilities.

I don't know much about the DJ500, but the Canon Bubble Jets are also NLQ
(Near LASER Quality) 360dpi and all that, totally silent, and the ink is
DRY as soon as the paper comes out of the printer.

But the BJ10ex does take 10 minutes to print a page of graphics (until I get
my hands on a faster driver).

Some people have been debating whether TOS in ROM is a good idea or not.

The pros are that it is instantly bootable, you never have to wait minutes for it to load from disk. The cons are that it is expensive and sometimes awkward (at best!) to upgrade the ROM chips. Well, why not use EEPROMS instead? In the long run, it certainly would be cheaper than constantly buying new ROM sets, especially for the user. To upgrade, all you would need is a special program that updates the EEPROM to the new TOS, and away you go. No muss, no fuss. You get the best of both worlds, fast TOS loading time, and easy upgradeability.

As far as I know, you are out of luck. You need the newer 128 kByte MAC boot ROMs to run system 6.0.x. To the best of my knowledge, Aladin never supported the 128 kB ROMs. Thus, Aladin is pretty obsolete nowadays. You should consider to dump the Aladin and get Gadget`s Spectre GCR.

955. Adding a second Hard Drive with new LUN. Help.

Newsgroup: comp.sys.atari.st
Date: 1992-01-28 23:50:02 UTC
From: jmack@b11.ingr.com
Message-ID: <1992Jan28.235002.25541@b11.ingr.com>
Source record: 226296
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I am having trouble adding a second hard drive to my 520ST. I have a Berkely BMS host adapter with an Adaptec 5000 (4 MFM ports) SCSI card. My first drive is logical unit 0 and has always booted/worked fine. I added a second drive as LUN 1; the supra software lets me format and partition it OK but I can't get it to be recognized as having partitions F, G, and H when I boot up. (Icons are there, but the driver doesn't recogize those drives; ie. DRVBITS doesn't have them in it.) My first drive has C, D, and E. Any help on how to get my second SCSI 0, LUN 1, drive to have partitions F, G, and H would be greatly appreciated.

956. Amiga SW/HW, Atari ST SW, modems, monitors, SCSI HDs for sale

Newsgroup: comp.sys.atari.st
Date: 1992-01-29 00:51:34 UTC
From: clf3678@ultb.rit.edu
Message-ID: <1992Jan29.005134.17758@ultb.isc.rit.edu>
Source record: 226351
Cross-posted to: comp.sys.atari.st,misc.forsale,misc.forsale.computers,comp.sys.amiga.marketplace

This is a repost of an earlier post. More stuff added, some prices lowered!

The various items listed here are for sale. If you are interested in anything here, please contact me via:

GEnie: C.FREEMESSER
Internet: clf3678@rit.ultb.edu
clf3678@ritvax
Phone: (716)328-5505 after 6pm EST

Prices do not include shipping. Will make a deal on multiple purchase of items, but prices are pretty low. Everything listed here is in PERFECT working condition! I'll find out the EXACT UPS shipping charges for anything you want to order. I've got more stuff than I need, and a big tuition bill coming, so I need to sell this stuff soon!

Amiga 500 computer system. About 4 months old. Includes the computer with a 1MB Supra memory expansion (total memory 1MB). This was one of those starter kits that came with the Amiga 520 RF/color composite adapter, TextCraft Plus, Tetris, and Where In the World is Carmen Sandiego. Complete with all manuals, disks, original packaging, cables, etc. I will throw in a copy of "Amiga for Beginners" by Abacus Books, a few European mags, and Gauntlet II. I'll also include the original reciept for everything so you can take advantage of the remaining warranty period. Very little use.

$325

Golden Image 880k Amiga external drive. Very little use on my part. Purchased used, but is in EXCELLENT condition. Also complete with manuals and original packaging. Warranty card was never sent in, so you can probably get FULL warranty on it.

$60

DataFlyer Plus hard drive interface for Amiga 500. 1 1/2 months old (at most). Sidecars onto the Amiga 500. Not just the board, but the complete steel case as well. With original packaging, disk, and manual. The manual, however, is missing 4 pages (fault of factory, not me). I'll include the original receipt for it so you can take advantage of the remaining warranty period.

$120

Maxtor 7120SR hard drive. 125MB, 3.5 inch SCSI embedded drive. Data transfer rate of 960K/s @ 21ms. Manufacture date of 9/28/91. This drive has seen little use! I bought it in November to replace an ailing drive on my BBS. Now that I've taken down my BBS, I'd like to sell the drive. It's a low-profile (1 inch high) drive. Nice and quiet, and FAST! Paid $380 for it. Note that you have about 9 months left on the warranty! I will include a copy of the original sales slip so you can take advantage of said warranty (if you need to).

$330

Magnavox RGB Monitor 80. This monitor accepts both digital RGB and color composite signals, and has a front switch so you can go between them on the fly. Looks to be about a 13 inch screen. Has sound capability (RCA jack input). In very good condition. I used this monitor in composite mode on my Amiga until I got an analog RGB monitor for it. You can hook up such things as an IBM computer (with CGA card), VCR, Nintendo, Atari XL/XE and Commodore 64/128. Owner's manual is included so you can make specialty cables for the RGB port.

$90

BMI monochrome monitor. A little old, but works just fine. Green phosphor display, no sound. Ideal for use on older computers like the Apple II series (which did not require sound). RCA jack for video input.

$25

Zenith Data Systems 2400 baud modem. Only used a few hours. This is a "standard" modem, with Hayes compatibility and a size that fits easily under a telephone. Has the standard 8 LEDs on the front, with power switch on back. Includes manual.

$65

Microcom AX/2400C modem. This is a 2400 baud modem featuring MNP levels 1-5. Microcom invented MNP, and now you can have a real Microcom modem! It's been on my BBS for about 3 months, but since I don't run a BBS anymore, I'd like to sell this modem. It's got lots of dip switches to set just about everything. Both asynchronous and syncronous operation with a front switch. There is also a "talk/data" button on the front, along with 7 LEDs. Owner's manual and original packaging included. This modem features both full Hayes compatibility and Microcom's own protocol.

$90

Amiga Software (all include boxes and manuals):

Alternate Reality: The City.....$10
Major Motion.....$10
TransWrite (latest version).....$40
Wings.....$30
Battle of Britain (LucasFilm)....$15
FirePower.....$10

Atari ST Software (all include boxes and manuals):

Joust.....$5
Great Battles (Napoleonic/Civil War).....$10
King of Chicago (Cinemaware).....$10
BattleHawks: 1942.....$15
Sub Battle Simulator.....$10
Hole-In-One Mini Golf (2nd disk bad).....$2

Okay, enlighten us, which computers are out there that are less expensive
than Atari computers, and are far more capable.

Start off with the $349 Atari STE 512K. (Current price, Toad computers)
I find this fair, as most people have 8MHZ machines. An STE with blitter
chip, stereo 50Khz sound, Midi ports, SIMM, Instant boot, 640x400 mono.

Next, step up to Mega STE1 for $999. 16Mhz with cache, 68881 socket,
VME card slot, Built in HD ready, and all the previous model's features.

L'ets stop here temporarily. (Please, no remarks in the "AH! you know
the TT doesnt have a chance in such a discussion" sense.) We can discuss
the TT line after, thats all. Or is the TT the only thing you can pick on?

You're welcome.

> Secondly I have some questions on the Minix file-system:
> - Is it true that the filename-length is restricted to 14 chars?

For strict compatibility with Minix, yes. If you don't care about this, newer versions of mfs provide the option of formatting the disk to understand longer file names (e.g. 30 characters).

> - Is the contens of mfs0541.zoo from aa suitable to the effort
> of creating a Minix-like file-system and

Yes, I think so.

> - if it is suitable, do I need any additional sources for this purpose?

No, although I would certainly recommend that you have a copy of the MiNT source code if you want to modify the minix fs source code.

> Finally, if I try to write an appropriate file-system on my own, would it be
> sensible to use the file `tosfs.c' from the MINIX sources as an idea and
> basement to extract and modify in order to supply an alternative, UNIXMODE-able
> file system?

Yes, I think so. In fact, the easiest thing to do would probably be to modify tosfs.c and re-compile MiNT to always provide built-in UNIXMODE.

(Of course, if you're *really* ambitious you might want to re-write the TOS file system entirely, e.g. by getting rid of all calls to GEMDOS and reading the disk directly -- this would provide better speed and more flexibility, as well as eliminating things like the 40 folder bug. Such a project would be quite difficult, needless to say :-).

Source record: 226357

the address of any member of TCB (The CareBears)? If clarification is necessary, I'm referring to the Swedish 3 member demo crew that did "The Cuddly Demos" and is a member of The Union. They also made TCB Tracker (A commercial .MOD file player/creator program) and Enchanted Land, a very good (supposedly commercial, but not here in America) game for the Atari ST.

I've already extracted (with MUCH effort) one address from the title screen of The Cuddly Demos, but I'm wondering if the three addresses within that lengthy scroll-text are outdated. I mailed to the first address and am still waiting for a reply (if I ever get one). I just want to talk to them. They're... MegaMighty! :-)

Nope, it doesnt even begin to work, sadly.

963. HELP WANTED in handling forms !!!!

Newsgroup: comp.sys.atari.st
Date: 1992-01-29 08:47:00 UTC
From: kuykens@amc.uva.nl
Message-ID: <1992Jan29.094700.69@amc.uva.nl>
Source record: 226181

Hi there,

Twice I have been trying to develop a shell as an interface to
a TTP program I am working on. Twice I bumped onto the same problem.
I use a form defined in a source file to perform user interactions .
I have two problems :

1. How can I handle an edit field, i.e. how do I set and get
the string's value ?

2. The form_do seems to work OK for buttons and switching
between edit fields. However, when I stand in an edit
field characters entered on the keyboard do not appear
in the field. ALso, in some cases I am not allowed to
place the cursos beyonf a certain position in the editline.
I DID set the text template to allow to fill the complete
box.

Could anybody give me a hint on this issue ? I would appreciate some example
code which would illustrate the solution. If possible please send responds
through e-mail. I do not read this news item regularly.

thanks, Hans Kuykens

I am a little confused by the recommendation to get TOS 2.06 instead of 1.4 for an `ordinary' ST. Please unconfuse me. I thought the 2.xx chips couldn't simply be plugged in to a pre-STe machine? If it turns out that you can, then that's great. Or is this just a veiled reference to the TEC mod? Also, since finding new ROMs in the UK is pretty tough going, would there be any problems expected if I were to get a set from the US?

Cheers,

I haven't played Dungeon Master that much (lack of time and I've only played it at my friend's place) but how many levels are there in total? I've only reached about the fourth and I think I've heard of a seventh and possibly (?) a twelfth.

Chris.

966. Sources BackupST

Newsgroup: comp.sys.atari.st
Date: 1992-01-29 10:25:55 UTC
From: fred@cv.ruu.nl
Message-ID: <1992Jan29.102555.7638@cv.ruu.nl>
Source record: 226363

Hello BackupST users.

Some of you have asked me to send the sources of BackupST. As you all know I don't have an Atari ST anymore, but that doesn't mean I am no longer interested in the direction BackupST is turning. I would like to keep the development of the sources more or less organized. Nobody is pleased by having multiple incompatible versions of the same program on the net.

That's the reason why I have setup a mailing list to help organizing this. Everybody who aksed for the sources have been put on the mailing list. I have send mail to the mailing list, so if you asked for the sources but didn't receive mail from the mailing list, let me iknow.

Requests to be put (or removed) on (from) the mailing list can be send to backupst-request, and your name will be added (removed) to (from) the list.

I will distribute the source via this mailing list. What I would like to see is that all your contributions, bugfixes etc. are send via this mailling list. From time to time, we should come up with a new release etc, and distribute the binaries via the net.

Technically I am not forbidding you to do as you please. The sources will be send under the GNU general public license, so nobody will have any commercial gain from them.

Fred

I never said it was a good solution, Roger, and I know it's "not the best" as I said before.

I only come in contact with these binaries through the Uni I go to where we only use IBMs (they still think Atari's a games machine) so it works best for me to do all of the unarchiving and uudecoding on campus so that the programs are ready to use on my floppy disk when I get home.

It's only a suggestion for those who don't know how to get the sources/binaries for all of the archiving programs for the ST but have them on a PC. :-)

Chris.

But as the 80386SX have a 16bit databus, it is indeed a 16 bit
processor. The same way the M6809 and 8088 are 8 bit processors,
the M68000 a 16bit and the M68020 a 32 bit processor. If this
practice is not followed, you can say that the M6800 is a
8 bit processor and the M6801 a 16 bit even they are almost
identical.

You don't get this with a A2000 built by CBM.
Why ?
Commodore still uses an THOMSON MC68000 havin only 24 adresspins giving 16MB of liear adresses for RAM,ROM and hardware.

With the MEGA STE you get the same possibilities:
4 MB with SIMMs
10 MB on the VME-Bus
2 MB for ROM and hardware

With a new processor in your machine (A3000, TT, SST-Board, TURBO30, ...)
you can try to face the next frontier (4GB)

remember: Don't compare APPLEs with PEANUTs

970. HD-floppy drive (1.44 MB) and Atari ST

Newsgroup: comp.sys.atari.st
Date: 1992-01-29 12:51:40 UTC
From: liebsche@Informatik.TU-Muenchen.DE
Message-ID: <1992Jan29.125140.20329@Informatik.TU-Muenchen.DE>
Source record: 226361

Hi Atari Users,

I have got a question:

Several weeks ago I bought the HD-Kit from Hard&Soft A.Herberg and
the TEAC FD 235 HF floppy drive (also from Hard&Soft).
Calling Hard&Soft they said the controller VL1772-02PC in my MEGA ST
is ok, but it doesn't work at all (grumble :( ). So I changed it to
the WD 1772 PH 02-02. Now the HD mode runs for several minutes, but it
stops as soon as the computer has 'warmed up'.

Who has any experience with HD-Kits and floppy controllers?
Who has the same or similar problems and isn't satisfied with his
HD-Kit?

Thanks for any information and help.

Andreas.

971. TOS 1.4 fixes?

There are 14 levels in Dungeon Master, counting the one you start on (some people don't, since there are no puzzles or monsters on this level). You have to go down to level 12, back up to level 7, down again to 14, and up to 13 where you finish the game.

> .PDF files and their progeny.

The 1.33i installation to double-sided floppy disks requires two disks. The first disk holds the binary distribution (ie the programs, the include files and the libraries), the second disk holds the documentation and example programs. The documentation in the distribution tells you how to go about doing this.

Incidentally, if you put source code on a RAM disk (and remember to back it off to floppy afterwards!), the program works fine on a 1 meg system with a single floppy drive.

Of course, there are guidelines and 'establishing principles' that should probably be observed. For instance, comp.sys.atari.st is oriented toward Atari ST computers, not Amigas or NeXT or Macintosh computers. One would expect information in the newsgroup to relate to the Atari ST.

By Mr. Carter's logic, one should feel free to post about abortion in comp.sys.amiga.advocacy (for example) with relative impunity. After all, 'you post where you want'....

For those who don't see (or don't want to see) that there are certain principles which, when followed, enhance the learning and enjoyment one may obtain through reading a newsgroup, I would point them to the articles posted every month in news.announce.newusers. There are articles on 'netiquette' and 'posting rules' which it would seem Mr. Carter omitted from his reading schedule ...

I have now uploaded to atari.archive Unix versions of the following:

zoo 2.10
arc 5.21
and 2 versions of lharc.

These have all passed through the USENET News. Lharc.orig.tar.Z is a
patched version of lharc which handles correctly zero length files.

Maybe Howard Chu could also post his latest version of arc 5.21e.

Cheers,

> really _needs_ multitasking.
That's true. But I think Atari hesitated with MultiTOS mutually, due to
compatibility problems. Most of the software currently available are
programmed so dirty or individually that they cannot run within a
multitasking environment. Try MultiGEM to check out which applications can
deal with multitasking and which cannot. -> If Atari comes out with MultiTOS,
they have to force all developers to rewrite their software - more or less
entirely.

> E) Do we really need to reboot to change resolutions? Come on Atari,
> you can do better than this.
On the TT, switching resolutions doesn't perform a reboot.

> II) Hardware bitches
> A) Why is TOS in ROM? What a stupid idea. Sure I can turn my computer
> [...]
If I think of all my DOS using friends that call me up late at night
and beg me to repair their f**king system, because one driver killed another,
the setting has disappeared, the mouse has gone, the screen is black,
and so on, and so forth...
What I want to mention is: You can't kill your OS if it is in ROMs.
This is a very important thing for inexperienced users. The ST is also
bought by young children with parents without computer knowledge, and
it could cause much trouble if an OS is as easy to shoot up as e.g. DOS
(or even Unix :-) .

> B) Our graphics modes suck. 640x400 mono is great for work. But everyone
> else has at least 640x400 256 colors available now. The new TT

Being a TT owner I have no more complaints.

> D) The power supply/keyboard/mouse all suck. The keyboard is mushy, but

> wearing out. (Again Mega/TT seem to deal with this.)
The TT keyboard is quite fine, and I really like it.
> E) Non standard connectors. ACSI, monitor and drive ports, a male rs232
> port?!?!?! Come on! If you are going to introduce new connectors, at
> least give them advantages over the standard connectors.
No more wishes about connections on the TT.

> Let's let each owner cut their own machine down.
I only wish my TT to

1. have 256 colours in 640x480 resolution,
2. run Spectre without nasty bugs,
3. get MultiTOS,
4. get a CHEAP Unix, BSD or Mach Kernel.

The main problem about the TT is its unreasonable price.
I can get a fast 386DX clone with large hard disk and the new BSD 4.3
for less money than Ataris System V disk. That's not fair. I never
wanted a BIM-compatible.

> Then we might actually learn something from these discussions.
Hope so, too.

You should try MultiGem for the ST. If your programs are GEM-conform,
you will not have any problems with it.
In Germany it costs about 150DM, that are about 100$.

984. MASTER V6.0 (SHAREWARE)

Newsgroup: comp.sys.atari.st
Date: 1992-01-29 19:45:40 UTC
From: edgar@pingu.saar.sub.org
Message-ID: <H.gQSVg8w1z5s@pingu.saar.sub.org>
Source record: 226395

Hi!

If you are not interested in commandline oriented shells, you should say 'n'
now. To everybody else, i have to offer a special goodie:

The newest version of MASTER (V6.0) is now available as SHAREWARE.
Today i have uploaded it to cs.uni-sb.de in /pub/atari/shells. Look
for master.zoo.

What is MASTER ?

It is a shell for all Atari ST computers. It feels a bit like COMMAND.COM and
a bit like /bin/csh for unix. If you have worked with Gulam or similar shells,
you should take a look at it.

Which resources do you need to run it ?

An Atari ST computer with at least 150 kB of RAM, a single-sided disk drive and
TOS version 1.0 or later. MASTER will run on a TT, but some features might not
work (probably you would never need them).

What are the basic features of MASTER ?

You get many built-in commands, editable command lines, history, expansion of
shell-variables with a single keystroke and file-name completion. MASTER can
execute external programs (TOS, GEM or MiNT) or batchfiles. You can use i/o
redirection for any builtin or external command using >, >>, 2>, 2>>, 2>&1,
1>&2, <, << and | or the special variable-redirections of MASTER into and
out of shell variables =>, ==>, ->, -->, <-.

What are the advanced features of MASTER ?

You can use most of the extended argument passing conventions ever mentioned on
the net (including MWC, xArg and the Atari standard) thus passing up to 32 kB
of parameters to any program knowing about these methods (BTW: 32 kB is the
limit that TOS has for passing environments to programs, with xArg you could
pass as many bytes as you like).
You get symbolic links (much like those in MiNT - but we had them back in
1987) that affect any program using GEMDOS filesystem calls. You can also watch
the activities of programs related to files.
You get pipes (using in-core-buffering instead of temporary files) between any
two commands wether builtin or not.
You can use job-control in TOS (not only with MiNT installed!) much like in
the csh under BSD. For example you could say:

less example.txt
them inside less press ^Z
back in the shell, you could say

```
emacs another.c
then inside emacs press ^Z
back in the shell, you can either
go back to emacs with "%%" or "%2"
or
go back to less with "%1"
then finish less
and back in the shell
restart the suspended emacs with "%2"
...
```

Programs doing screen-output can be stopped after a specified amount of lines (usually a page) by appending a single |-symbol at the end of the command. When a program is stopped in this way (looks like "command | more" under unix), you can see the next page or line or suspend screen output until a specified string (actually a regular expression) occurs in the output line. And you can even say "!command" and start another shell-command (which can be any program). Job-control will work in these cases too!

Which interfaces to other programs has MASTER ?

MASTER can be called with a command as parameter. It can also be called via the system()-call (it hooks itself into the _shell_p vector) and this call IS RELIABLE (there are NO PROBLEMS with memory ownership as mentioned for other shells on the net). MASTER can for instance be used as the underlying shell for VENUS, the GEM part of GEMINI (though venus.app has to be patched to expect MASTER instead of MUPFEL). The values of shell-variables can be asked about with a special system call. The shell itself can be expanded with so called Master Module eXtensions (example modules are included in the distribution).

- Edgar

Before i forget it. These are the builtin commands:

```
alias ask beep bye car cat
cd cdr chmod chrono close cls
comp copy cp date del delete
diff dir dirs dump elapsed era
erase err eval exit export fgrep
files find format free get getline
goto grep help history inverse jobs
kbd key kill ll ln lock
ls md memdump mkdir module more
move mv normal on open pack
page pause popd printf pushd pwd
quit rd rem ren rename restore
rewind rm rmdir rs232 save set
set? setenv shift show shrink sleep
status time touch type unalias unlink
unlock unpack unset unsetenv version which
zcat l25 l50
```

The available control constructs are:

break continue else goto if loop
while

I have 2 machines which came w the 6 chip set, and one that came with the 2 chip set.

I put the 2 chip set into all 3 machines. All I had to do was move a resistor and place a jumper between 2 pads. (And plug in the 2 chip set...)

Works GREAT!

As Atari has decided to do another change, the Roms will be TOS 2.07, may
be next Xmas when they will be available, but then it could be TOS 12345..

No you can't get UK Roms in the USA, why not give Atari UK, a ring
some time next year..:-)..

993. Re: Amiga geeks, read this

Newsgroup: comp.sys.atari.st
Date: 1992-01-30 03:15:11 UTC
From: Azog-Thoth@cup.portal.com
Message-ID: <53650@cup.portal.com>
Source record: 226390

Wrong. The posting I made was not saying that only Atari users should read this newsgroup. The point is if you dont have anything productive to say, dont say it. Dont go bashing Atari for no reason. I said before, and again, I like to read comparisions about different machines, but youve got to support your claims with evidence, not, my computer is better than yours.

All I am saying is that the people who own Ataris own them of their own free will. A while back, someone posted an Atari ST for sale, and this Miller guy posted that it was a joke. Perhaps he didnt think that the seller was upgrading to a new ST?

And I dont really care that there are other, better, etc, machines than what I own. Perhaps you should think twice before thinking that is true. I own approx 20 different computers of different architecures, and I would not rate any one of them as better or worse than any other of them. I call myself a collector, I collect computers. Currently of interest is my VAX 11/730, a MicroPDP-11, and an AT&T UnixPC (aka 3b1).

Shall I compare? Its impossible. The VAX has a great user interface, if you like CLIs. Its also multitasking, regardless to personal opinion. The PDP-11, well, thats mostly a curio (sp?), considering that its the oldest computer architecture that is still supported, etc, today. The first PDP-11 (11/20) was produced in 1970, and in 1992, the latest model that I know of is the 11/83 & 11/84. 20+ years is a helluva shelf live... IBM mainframes can kinda claim that, but theyve dont other stuff... I digress.

And perhaps it occured to you, or not, that I once did own an Amiga, but no longer. If you know my name and postings, youll know that the reason I dont own one is the users attitude turn me off. Atarians know what they have, and like it.

(BTW: my next addition to my collection will hopefully be either a Sun 3/60, and a MicroVAX 2000. The MicroVAX uses less power than my 730, and I can fit it on my desk :-)

Apples to oranges...

Billy D'Augustine
Azog-Thoth@cup.portal.com

Yeah! MR.CARTER. I LIKE that. And yes, if you want to post about abortion in
comp.sys.atari.st, feel free to do so.

Although, I wouldn't.

>
>For those who don't see (or don't want to see) that there are certain
>principles which, when followed, enhance the learning and enjoyment one may
>obtain through reading a newsgroup, I would point them to the articles posted

Yes, I have principles which I follow, based on a philosophy that observes
that information is light, and the mind is the lens. Focus on what you
will...too, many times in histories past has information been focused for
people deemed too idiotic to find or interpret their own views from what
they read.

The reason why everything is arranged the way it is, is because rn hasn't
caught up with the times. In fact, rn is incredibly crude. There are much
better ways to arrange all of this information.

And, what makes you think this particular arrangement fosters learning?
RN is probably the most confusing program on the net. Its horrible
to work with. Although, I am working on that, through PC technology. :)

>every month in news.announce.newusers. There are articles on 'netiquette' and
>'posting rules' which it would seem Mr. Carter omitted from his reading
>schedule ...

What makes a good netter to you, might not be great for others. This is all
based on the expression of the human condition in dealing with technology.
The wide differences in technology backgrounds each one of us shares gives
very different viewpoints on what to express, or to emphasize what is most
important to us.

You simply don't have a right to deny a persons experiences just because
they aren't excatly the same as yours when dealing with this technology.

So post what you want people. And lets continue the discussion!

995. Ack! My STe is dying! (dead?)

Newsgroup: comp.sys.atari.st
Date: 1992-01-30 04:01:58 UTC
From: atilghma@sdcc13.ucsd.edu
Message-ID: <27947@sdcc12.ucsd.edu>
Source record: 226434
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Ack! I'm having serious problems with my STe system. If anybody
could offer some wisdom, I would appreciate it!

Symptoms:

(The first problem I caught) - MINT.CNF suddenly appeared
with random data scattered throughout the "normal" text.

The Desktop is now mistaking executables for Text files,
and is asking me if I want to view them. This
is happening perhaps 10% of the time, and I have
NEVER had this problem (in 6 months of intense use).

MiNT 0.92 is hanging much more often than usual - basically,
anything involving a large file operation, like
running GCC.

On most large hard drive read operations my screen is
overwritten with data :-(

Odd crashes every so often (usually non-repeatable).

On reset, the screen doesn't clear - so if I reboot from
the desktop, my hard drive boot is overlaid on the
old Desktop image.

My Hardware:

Atari 520STe (w/ TOS 1.62, bought in August 1991) - 4MB of RAM
ICD Host Adapter (original model) + Seagate ST1096N drive
DEKA PC Keyboard Adapter (w/ keyboard)
SM124 Mono Monitor

Does anybody recognize these problems? I think they're serious
and there's NO WAY that Atari's going to take back my computer under
warranty :-(... Eek!

996. Zoo problems continue

Newsgroup: comp.sys.atari.st
Date: 1992-01-30 04:30:41 UTC
From: ehohnbau@Bonnie.ICS.UCI.EDU
Message-ID: <9201292030.aa29694@Bonnie.ics.uci.edu>
Source record: 226388

I have this annoying problem with zoo. I have an old TOS (probably 1.0) and therefore cannot use Zoo without a shell. Someone was kind enough to mail me a shell and zoo still does not work. I think that my Tos is simply too old but I'm not sure. I also tried downloading that "starter.tos" program from an archive but it also does absolutely nothing.

Does anyone know why zoo will not work even with a shell?
I suspect the Tos, but can't substantiate it.

I think I'll do something less frustrating like read uncommented Assembly code :-).

Thanx
Eric Hohnbaum

997. Orange County Atari dealers?

From: chan@pyramid.cs.unr.edu
Message-ID: <2652@equinox.unr.edu>
Source record: 226391

Well here's my 2 cents worth of qualms about my Atari...

a. When I first got my 1040STf in 1986, it came with TOS 1.0.
The 1040STf had the same version until June 1991 when I opted
for a MegaSTE4. The original TOS was limited (user-wise) and
a little buggy.
b. Hated (when I never knew about RAMdisks plus when I couldn't
afford a hard drive AND when I only had one drive) copying
files (4 disk swaps for 1 file (2 verification, read, write).
c. Hated (and still hate) the mushy keyboard. Developed painful
wrists. (LOVE my MSTE's keyboard).
d. Hated the internal drive noise especially when the plastic
casing is cold and it's touching the drive mechanism itself.
The noise dropped as the computer warmed up (since plastic
expands when the power supply is on for awhile).

I guess that's all I can think of right now...

1001. Looking for low priced 68030 CPUs

Newsgroup: comp.sys.atari.st
Date: 1992-01-30 08:13:42 UTC
From: colonius@dino.DinoCo.de
Message-ID: <colonius.03ak@dino.DinoCo.de>
Source record: 226234
Cross-posted to: comp.sys.mac.hardware,comp.sys.amiga.hardware,comp.sys.atari.st,comp.sys.next.hardware

Hi!

I am currently looking for low-priced 68030 CPUs in smaller amounts (between 10 and 50), all speeds from 16 MHz to 50 MHz. Most interesting for me is the 33 MHz CPU. I am looking for matching 68882 FPUs as well.

If you know of a low priced dealer or distributor for said chips, then please email me. Commercial offers are welcome, of course. It really does not matter, where on this planet your low-price-source for 68030`s is - I am specialized in the import business anyway ;-)

Any help greatly appreciated!

Stephan

Hi

I just bought a licence for the MapleV symbolic math package for the Atari ST. It works very good and quite fast, but the problem is that there is no 3D plot possibility. My question is: Is there somebody of Waterloo University on the Net? Does somebody know if there are plans to devlop this feature?

Thank you in advance

Ciao --- Rick

> <deleted>

Anyone have any idea on how to connect an IBM PS/2 style muse to the ST in a similar way.

This is what the connector looks like:-

```
Key
/
O # O
#
O O

O O
```

Looks very similar to a Macintosh Lan connector but with 6 instead of 3 pins. The mouse in question is a three button one made by Logitech and has a 28pin(?) custom chip inside. 2 of the pins must be power and ground and a third is shield.

Any ideas?

The WD1772 is not designed to read track by track in a way you would
expect it, i.e. the results are not reliable. So without hardware
extensions, you won't ever be able to read Amiga disks with a 1772.
No way.

Yes, it is. It's the adress $FF8E21 and the lowest two bits are used
to switch between 8 and 16 MHz and to enable the cache.

>to GEM and do not even start it up at a reboot).

There is a relatively easy way to do this under MiNT; you write a program which opens a pseudo-tty as the server, then opens it as a client, too, then spawns a shell (like bash or tcsh) which is on the client end of the pty, and then reads input from the console (via Fgetchar() or Bconin()), and converts F-keys and so on into vt52 strings, before passing them down the pty to the shell. It must also print the shell's output on the screen (although it could just leave the shell's o/p attached direct to the console). (The select() call comes in handy here!)

Hope this helps some...

1013. Useful information

Newsgroup: comp.sys.atari.st
Date: 1992-01-30 13:55:17 UTC
From: vatec@sun.pcl.ac.uk
Message-ID: <1992Jan30.135517.13538@sun.pcl.ac.uk>
Source record: 226205

Hi fellow Atarians

Two reasons for posting this message.

1) Does ANYONE know what happened to that great ST NEWS?
It was a monthly disk-magazine, one of the best, and supported by some pretty important people. Stefan Posthuma and Richard Karsmakers (he of AVK virus killer fame) were the editors I believe. I stumbled across a couple of very old issues and got hooked.

Any info would be appreciated.

2) ST information

I have got hold of a book that lists some legal system variables. SO for the benefit of all, here are some useful snippets that many people might find useful.

A comprehensive list of ST variables, valid on all ST's.

Address (.Length) Name

$408 .L Gem vector for ending a program

$42E .L Address of the end of RAM

$432 .L Address of the user memory (TPA)

$43E .W If non-zero, a disk access is in progress

$440 .W Seekrate. See table below

Value in $440 Seekrate time
0 6ms
1 12ms
2 2ms
3 3ms

$442 .W Time span between two timer calls.

$444 .W If non-zero, a verify is performed after every disk access

$446 .W Contains device number of boot drive

$448 .W If non-zero, then screen refresh is 50hz

$44C .W Holds resolution: 0=low, 1=med, 2=high
(This can be set as well as read)

$44E .L Pointer to logical screen address

$452 .W If zero, VBL is disabled

$454 .W Number of vertical blank routines

$456 .L Pointer to VBL_queue

$45A .L If non-zero, assumed to be a pointer to a colour
palette which will be loaded at the next VBL
(Note: I'm English, hence 'colour'!)

$45E .L Address of video RAM which will be set during next
VBL

$462 .L Ongoing counter for number of VBL interrupts. This
is incremented every VBL

$466 .L Number of VBL routines executed

$46E .L When another monitor is connected, then this vector
is jumped to. Defuault is reset.

$482 .W If non-zero (set by an AUTO program) then the ST
will attempt to load a program called COMMAND.PRG
as an alternative to the desktop.

$484 .B Attribute for console output
BIT Meaning
0 Key click on/off
1 Key repeat on/off
2 Control-G bell on/off
3 SHIFT key checked on/off

$4A2 .L Pointer to saved registers after a BIOS call.

$4AC .W Storage for X coordinate of cursor after ESC-Y

$4BA .L COunter for 200hz system clock

$4C2 .L 32 bit vector for connected drives 0=A 1=B ....
Changing a bit will make the ST believe that the
relevant drive is on/off line.

$4CE 8 x .L 8 addresses forming the VBL queue. Some free so you
can install your own VBL routines.

$4EE .W Incremented by 1 when ALT-HELP pressed. This forces
a hardcopy.

$4F2 .L Pointer to start of operating system

The above system variables can be used to bypass certain TRAP calls, such
as XBIOS 5 (setscreen). They are legal variables, and shouldnt change.

Any questions: Mail me.

Try SMS Synthesizer. In case you can't get it in the US, I can post it to a.a.u.e (if I can find a way to get the files from my ST onto my workstation, that is).

In short: SMS Synthesizer emulates a six-channel (4 tone & 2 percussion channels) synthesizer on an ST. It can be used to integrate MIDI songs into your programs (check out OXYD, SPACOLA or MIDIMAZE 2 if you want to see examples). It works on an ST, there's *no* special support for the STe DMA sound.

The program is free, but the module that's built into an application is not. You can get it from SMS's author for DM 40,- .

Stay tuned ...

Jens Kilian

One of the UK ST mags (either Atari ST User or ST Format) recently said
it would be out real soon, but I don't know how soon that is. The
article showed some screen shots which looked OK and quoted someone
as saying it will not be noticeably slower than any commerical 3D games.
I'll believe that when I see it but hope it's right.

> Let me know if you know....

You must be joking. The TT is so different in its hardware and chipset compared to an ordinary ST, that a soft emulator had to be totally rewritten. If I started counting all applications which don't run on the TT, I would never dare to try PC Ditto.
Ont the other hand, with the increase of performance (about five times) it could be an interesting project for the developers of PC Ditto to make a TT version, using its 68030/68882 features. Nevertheless, Fast RAM would surely be _very_ problematic to supply for DOS usage.

My personal opinion is: I bought a TT because I hate BIM-compatibles with their lousy OS, therefore I _never_ wanted to run DOS on my TT :-)

Regards, Markus.

I am having a problem with a SM124 (Goldstar) monitor. When the screen is mostly black, the white portions of the screen are very dim, and as more white is displayed the white return to normal brightness.

Has anybody seen this problem before? Is there somthing I need to tweak on the monitor?

Even better, could someone post the difference between TOS 2.06 & TOS 2.07?

I'm thiniking of buying Fastech's switchable 25/8 MHz accelerator which also
has an option for TOS 2.06 (switchable to your ST's older TOS)... However,
their representative told me that Atari will send them TOS 2.07 in a couple
of weeks.

This is not to gregg but to the fool who was responding to him. Even the original NeXT cube (Which they don't even make anymore) with *only* a 68030 and 8 megs, did not have any gui problems. Don't compare intel architectures to Motorola. The NeXT with display PS has no lagging problems in the GUI. If you don't know what you are talking about. Be quite. Or do you just like the sound of your voice. Besides all the NeXTs now use 68040's, and they will blow away anything that commodore will put out for the next several years.

Cross-posted to: comp.sys.atari.st.tech,comp.sys.atari.st

Anybody using a Sony 1302 with an ST, how about a Princeton Ultra 14?

I am especially interested in difficulties, quality of display but
most of all, I want to know:

Do either or both of these monitors correctly size and center all ST
screens automatically?

That is, do Mono *and* color modes switch easily without lots of fiddling?
I know that Nec 3Ds save settings in Nvram, what about these two machines?

I'd prefer email responses, because I'm behind on my c.s.a.st news
8-). I'll post a summary if anybody is interested.

1028. Selling (older) Atari's

Newsgroup: comp.sys.atari.st
Date: 1992-01-30 21:25:31 UTC
From: rob@spot.Colorado.EDU
Message-ID: <1992Jan30.212531.17326@ucsu.Colorado.EDU>
Source record: 226222

Tip for the day. The net is a LOW market. Readers on the net are educated about the product, and about the true value of the product. When I bought my Atari, it was from an ad on netnews, and I paid $350 for the system.

1040STf, 1Meg, mouse, Atari SC1224 color monitor, Citizen 120D printer, 1200b modem, lots of sw.

When I sold my system, I wrote down this description, paid $19.50 to run an ad in a local newspaper (Rocky Mtn News, Denver) and sold it for $560 in two days.

Moral: Stop wasting the bandwidth. I know it seems that the free advertising space is a bargain, but I paid $19.50 and gained over $200. If I advertised this system for "$575/obo" on the net, I would get no response. In the paper, I got three calls the first day, and the buyer picked it up on the third.

1029. ZOO V2.1 is bugfree, GCC library isn't!

Newsgroup: comp.sys.atari.st
Date: 1992-01-30 21:39:06 UTC
From: dxper@dtek.chalmers.se
Message-ID: <8781@chalmers.se>
Source record: 226218

Someone here in the group might remember that I claimed that zoo v2.1 wasn't entirely bug-free but it seems now that the problem wasn't a bad port but had to do with a bug in the GCC library, where localtime() could make programs bomb if it was fed with bad time.

So hopefully when JRB releases a new GCC update and Zoo gets recompiled with it we can start use Zoo without the "bomb paranoia".

Credits go to JRB who found the cause of the bug.

...yet another step closer to bugfree utopia...

Source record: 226235

itschere@techfak.uni-bielefeld.de (Torsten Scherer) writes:
:[stuff deleted]
: All these files are of
: cource uuencoded. They're also split in more smaller files. When I try to
: uudecode them, I olny get the message "no end line". How do I have to
: put these fragmented files together again?
:[stuff deleted]

Save the letters to disk first of all. Then remove all headers from the files. Also check for garbage at the end of every file. The last file must end with an 'end'. Use your favourite text-editor and link all the files (in the right order) into a HUGE file. If you do this from a command-line enironment (UNIX or some shell for Atari) you could also use the cat-command like this:

```
cat file1 file2 ... filen > HUGEfile
```

Now you have a continous file that you can decode. Just run your favourite uudecode-program on it and the file hiding inside should show up! The uuencoded file is often about 35 percent bigger than the original (often packed) file since what uu does is to take a 8 bit binary file and convert it into a 7 bit ASCII (?) file.

To uuencode a file is quite easy, just make sure you read the instructions for YOUR uu-program before starting. The uuencode that we have here on our UNIX-machine works like this:

```
uuencode original_filename new_filename > uue_filename
```

The 'original_filename' is the name of the file you wish to convert. The 'new_filename' is the name the file will get when you later converts it back (could be useful if you transfer files from a machine that supports more than 8+3 chars for filenames to a TOS/DOS-filesystem). And 'uue_filename' is the name of the uuencoded file that gets created (the file you will transfer with Email for example).

Hope this helps!

Try opening your STE up and reseating the chips in it.

Check your local line to make sure your getting consistent 120v 60Hz

Some of them are recognizeable, some aren't. If transport your STE
OR frequently tunr it on and off, chip seating is a problem.

-Good luck

-Greg

1038. Crack Art!

Newsgroup: comp.sys.atari.st
Date: 1992-01-31 01:42:19 UTC
From: chan@pyramid.cs.unr.edu
Message-ID: <2668@equinox.unr.edu>
Source record: 226226

I have ftp'ed Crack Art (crackart.lzh) from atari.archive.umich.edu.

Before I start, let me tell you that the program itself is English (with a little German splashed here and there). The document to Crack Art is in German. I would (will eventually try) like to get in touch with the authors of Crack Art about an English version of the text (or find someone to translate the document) or if someone out there knows of an English version.

Anyway, here's a small description about Crack Art (and if you don't read German):

Atari ST/TT compatibility. Can load/save .CAx (Crack Art), .PIx, .PCx, .SPU, .SPC, .NEO, .IFF, .ART, etc. 50/60hz changer. 9 screen capability. Animation.Special effects (color-wise... AWESOME (a lot of fun), dithering...). All the drawing tools. Block tools (many...!).

Since I don't read German, I've had to explore a lot.
Use both right and left mouse buttons for different things...
[Esc] - Block. Function keys - zoom (F1-F10).

Tools are divided up into a hugh grid (very graphical)...

Loading other files are converted to 16 colors (ST, TT(??))... .SPC are great!

TONS of stuff...

Try it!

Please... if someone wants to let me know of an English version, let me know...
(Or if someone would like to translate the 118k document file...)

Later.....

1039. ST's memory architecture

Newsgroup: comp.sys.atari.st
Date: 1992-01-31 02:13:29 UTC
From: carter@cae.wisc.edu
Message-ID: <1992Jan30.201329.11788@doug.cae.wisc.edu>
Source record: 226229

Well, for those of you who DID run, MS Word 5.0, you probably already have had this feeling for sometime now that the ST is for the first time, unable to use MultiFinder effectively with 4 megabytes of memory.

I seriously believe, in my opinion, that the only thing that has kept the ST machine alive, has been the Spectre GCR.

Now, to do anything serious with your machine, you can't use MultiFinder at all with PM 4.0, MS Word 5.0, and Super Paint loaded under multi-finder. They simply won't fit anymore.

If this doesn't put a nail in the ST architecture I don't know what will.

Add to this fact that System 7 is right around the corner. I think System 7 on a 4 Meg machine is quite ludicrous with the current upgrades Mac software are expected to acquire during the time we actually get System 7.0 compatibility.

Quite plainly boys and girls, if and when you do get System 7 running your going to cry uncontrollably as you find all your favorite software unable to run concurrently, for lack of space.

For those of you who own TT's, I quite frankly hate you.

Now on to the next topic:

-----Bad News Ends..Good News Begins..

But, there are fixes of course for this calamity. Mr. Small's SST board of course. But when will it arrive. Does anyone have one? Probably not.
I suspect that Mr. Small has a VERY HIGH standard for quality assurance.
With this in mind, we can hope for the best. But we NOW need it more than ever. I have heard though, that you can't expect ANYTHING from Mr. Small for another 3-4 months, AT LEAST on this topic...ie (SST AND 3.1).
By that time, who knows how big other programs will be..PYRO?? Excel?? Wingz?

MS Word 5.0, runs rather nicely under MultiFinder 6.0.7. Comming in at a hefty 1024 minimum suggested memory size. Its quite large indeed. In fact, to run it effectively, with all the great features running...like spelling, grammar checker, Thesauras, you should have a size of 1536 at least.
((This is for <10K documents too...) you probably should go for 2048)

The program has changed a good deal. Sporting all sorts of fancy, more effective menu displays for easy point and click access, right on the ruler bar. For example, you can now easily select fonts, sizes right on the ruler right next to your style sheet selections. Quite nice.

And holy cow, you can even draw and edit drawing figures right from within Word 5.0. Very nice. Dare I say the print preview is faster, can't confirm this but the program seemed a bit faster from page to page.

Well, I would love to here your thoughts about this issue, I recieved so many letters about my views on net org that I almost had to take a break from studying...sheesh...

>uudecode them, I olny get the message "no end line". How do I have to
>put these fragmented files together again? I'm sorry, but I don't
>understand what's written in the Unix manual.

You might prefer to uudecode the files once you get them onto your Atari,
but that is a separate matter.

Just to uudecode them on unix, you will have to catenate the files
together in the right order. The unix command do that is
cat f1 f2 f3 ... fn > bigfile
Now you get edit "bigfile" to remove the unwanted between one
file and the next. First approximation to wanted stuff and
unwanted stuff: In the middle of the file, all lines begin
with an "M". Near the end, the rule changes.

Most of the recent files on atari archives are encoded with UUE, so
there might sequence letters at the end of the line to help you. The
help comes if you delete one or two lines too many. You can tell,
and start over. ha ha.

Then, you are ready to uudecode the files. The unix command is
uudecode < bigfile

This creates the binary file that you wish you had on your Atari ST.
Now you have a new problem. How to move the binary to the ST.
I hope you have a reliable method for moving BINARY files, cause
you need it. What I do, is to UUEncode the file into a text
file, transfer the text file to the Atari with kermit, and then
UUDecode on the Atari. So maybe you did not want to uudecode
the files on the unix box at all! Well, maybe you did, because
you can then examine text files before you decide to do the
hard part and move the file to your Atari.

There is regular posting that appears in this news group that
tells you much of this, and gives you hints on a bootstrap
process that helps you to get started. Once you get going,
it is not so bad, but that first hurdle is moving your first
binary file from a unix machine to your Atari.

Does anyone know if this program can "crack" the art of a game disk? I think
that's one of the main reasons for the program's existance.

I have _exactly_ the same problem. I did cure it by using the -z
option which "cures problems with some printers". However, be warned!!
I had a different problem 9 pages further on - the head would do the
second pass on the next line so the same line appeared twice, in light
type. I tried the drivers with the 24pin1/2.lzh packages at
atari.archive but couldn't get them to work. I only use my star
(24-200) in the holidays, and haven't tried this, but what does the
9-pin driver at 360dpi do? I suspect this is unsatisfactory. This is a
very annoying problem. The only solution (aside from someone writing
another driver, I suspect) is to download ghostscript, use dvi2ps to
convert your document into postscript and then use ghostscript's 24pin
driver to print the mess out. Pretty cumbersome (although it does
work, on my system at least)!

Does anyone associated with cs-tex know about this bug? I believe a
new version is in development?

David.

Well, I am also having major problems, I have an 520STFM with ICD adapter (ICD Plus + clock), with two ST1239N (Seagate 204MB), and one of them is reporting Sense $44 which is internal controller failure, yet when the drive warms up it works(this may take 10-15 minutes). Can anyone help as this is my boot drive which is failing...

1049. Mint 0.92 problems

Newsgroup: comp.sys.atari.st
Date: 1992-01-31 09:38:18 UTC
From: oli@math.rwth-aachen.de
Message-ID: <oli.696850698@ernie>
Source record: 226238

Hello everybody!

Yesterday I finally found time to try Mint 0.92 and Tcsh and ran into
some problems.

1. Tcsh runs fine when run as INIT from Mint or started by double-clicking
from the desktop, but will produce a bus error when started from MW2.
I tried renaming it MWINIT, calling MW2 as INIT, renaming it TCSH.TOS,
nothing worked. Tcsh also complains about a missing termcap entry st52,
which really isn't there, but I haven't scanned all the .ZOO-Archives
for a suitable termcap file yet. Tcsh doesn't run under MGR, either.

2. Under no circumstances I get ksh to read its startup files (login.ksh,
kshrc.ksh) when started as INIT from Mint or in MW2. They are found,
however, by kshs started from a ksh where those files have been read in
manually. I tried plenty of combinations of locations of those files,
location of KSH.TOS, current working directory and settings of PATH
and HOME (in MINT.CNF) - nothing helps. Ksh can't really expect the
files on U:\, can it?

3. Tcsh doesn't know the pwd-command. This one should be internal, I sup-
pose. Also, Tcsh doesn't use the substitute system font from NVDI but
the ROM font; I don't know what other shells do (forgot to look). Can
I change this by resetting the console device?

Oliver

It's none of the above! This misbehaviour occurs due to an error in
the STAR-firmware. Try getting the latest version of the
firmware-ROMs from your favorite dealer, it might help.

Message-ID: <1992Jan31.101449.13611@unibi.uni-bielefeld.de>
Source record: 226240

Hello world!

I'd like to know if anyone has got a quick idea on how to tell GEM to
use a bigger screen? My idea is to program a virtual bigger desktop screen
and I've already managed to tell the line-A emulator to use the extended
resolution, so that I can draw things using the line-A emulator and move
the physical screen around on the virtual bigger screen. But what I completly
fail to know is how to tell GEM that it can use more pixels. It simply
continues using 640*400 pix. Does anyone know a quick solution for this
problem or is it neccesary to retype the whole ROM-VDI driver to get it
to work???

Any mail would be appreciated,

Thanx & bye

TeSche

A funny thing like that happen to me, Programs ended up as files, only one disk drive icon, plus lots of other funny things..

Fixed by removing and replacing SIMM Rams, (Note; SIMM's don't just pull out, they swing out) a small piece of plastic seem to fall out of the SIMM sockets, so check sockets have not got any foreign matter there, use a small 1" paint brush to remove..

Is it just me or is the atari version of zoo (from Newcastle PDSOFT (NET))
a bit dodgy ???

The problem is, I down-load it, uudecode it and then run it from the desk
top as a TTP file, giving it 'x filename' as perameters, it works okay for
a while then for no reason that I can spot it stops working, just blinks the
gem screen off and back on without doing anything.

It won't run from gulam at all.

I'm using a 4Mb STe and normally do my dearchiving in a 2Mb Ram disc.
I've tryed just doing it on the floppy and still have the same problems.

I've just down-loaded it AGAIN and plan to make it read-only access, in the
hope that that will make it last longer !!!

Has anyone had simular problems ?

Or am I cursed |-)

1055. Help sought - G++ too slow!

Newsgroup: comp.sys.atari.st
Date: 1992-01-31 11:43:54 UTC
From: Andrew.Stratton@cm.cf.ac.uk
Message-ID: <9201311143.AA25024@v1.cm.cf.ac.uk>
Source record: 226159

I am presently running G++ from gulam and Neodesk 3 on a 2.5 Mbyte ST with 20 Mbyte hard disk. To compile a 'cout << "Hello world\n";' program takes 1 minute 19 seconds. How can I speed this up (I have TOS 1.4, and have set fast load bits, I also use CACHE90 - though I don't know if it does anything, and I have 400 K RAM disk). I run from within Neodesk 3 without unloading, and memory is close to the limit.

I may consider hardware purchases - such as memory, a faster hard disk (I presently have Supra hard disk, put together by myself). I doubt if an accelerator would make much difference - or would cost too much!

Thanks in advance,
Andy.Stratton.

I did write something like this for my port of JOVE to MiNT, but I didn't publish it at all.

Hmm.. mine didn't do that.. oh well.. it was only a hack for JOVE and BASH.

> T.Quester@mcshh.hanse.de.uucp

> and the above combinations but with exhh as the address

>Does anyone know his _real_ e-mail address. Better still, Thomas, are
>you out there?(!)

Well, it always happens doesn't it? Like buses. Anyway, I popped back to lodgings and to see some friends and what did I find on the doormat - a package from Thomas Quester containing AFX+, PFX+, lzh, fortune etc. I haven't had time to install it yet (I had some latex fonts to do and you know how long that takes...). But it looks reaaly good - well worth registering. You get an accessory to control afx while it is in the background (even turning it off for backup purposes).

I have been using the unregistered version so far and have had no problems. Mostly I have packed rsc files and latex style, inputs etc (no fonts!). Text compacts really well and no program can see that it is because afx intervenes.

I did write off to Double Click 3 weeks ago and enquired with their distrbutor here in the UK about DC Data Diet. I have had no reply and the distributor does not know when Data Diet will be in the UK. So I use afx instead. Perhaps DD is better, but I haven't had the chance to find out and afx pack works well.

Anyway, I would still like Thomas Quester's e-mail address so I can let him know mine. Thanks in advance and thanks to Thomas for a great program.

Message-ID: <1992Jan31.134432.24370@newcastle.ac.uk>
Source record: 226162

I was doing some work on my machine last night and installed a desktop acc called snapshot, I am also running running xcontrol. When this program was installed the machine refused to change rez from low to med (or med to low). I got a random number of bommbs (most common was 7) and once I got an alert saying something like stack overflow (I think). Them machine is an STFM 520 with TOS 1.4 and 2.5megs. Can only one explain the problem? (It stopped when I removed snapshot.)

Another question, I have just bought a Deskjet 500, can I get it to print when I double click on a text file and select print?

Cheers

Dave J

1062. Atari MGR utilities

Newsgroup: comp.sys.atari.st
Date: 1992-01-31 14:01:00 UTC
From: herborth@pinot.Waterloo.NCR.Com
Message-ID: <8917@ncrwat.Waterloo.NCR.COM>
Source record: 226151

I've just started playing with MGR again (Bammi's updated binary of the windowing system that runs under MiNT), and was wondering what sort of utilities you (other MGR users) use with it? Can you tell me a good place to get binaries/icons/fonts? Unfortunately, I haven't got what it takes to compile MGR sources...

Any hints or tips would be appreciated, too... Or a man page for MGR...

>Why, why, why, why, why?
I know nothing about Notator, but Calamus was developped around a new
concept of typesetting. This gives real WYSIWYG, in contrast with
postscript, which sometimes gives surprising results (not like you thought
you had designed it) and has proven not to be compatible with itself.
Especially with high resolution typesetters.
I wonder why why why you need an interceptor to convert Calamus
output for 300dpi laserprinters to a postscript file, since the creators
of Calamus provide drivers for every printer you can think of.
But yes, if you really want to go back to oldfashioned postscript,
for Calamus SL, there is a module to convert a Calamus document to EPS.
I suggest you ask DMC for it.
Bart.

1067. low-level formatter wanted

Newsgroup: comp.sys.atari.st
Date: 1992-01-31 15:04:21 UTC
From: costello@tolsun.oulu.fi
Message-ID: <1992Jan31.150421.15680@ousrvr.oulu.fi>
Source record: 226155

I have a SH205 hard-drive controller with Seagate ST251 drive. I attached the Seagate to my *nix-box (Convergent miniframe) and initialized it in order to make it work with my *nix and yes, it worked fine, but Atari ST with SH205 cannot handle the disk any more. I tried to format it with HDX3.02 and I got a couple of bombs. I guess that Convergent low-level formatted the disk in a way that ST doesn't understand. What I now need is a low-level hard-disk formatter for ST/TOS. Where can I find one?

From: D.M.Johnson@newcastle.ac.uk
Message-ID: <1992Jan31.154752.6012@newcastle.ac.uk>
Source record: 226163

Having installed CS-TeX on my machine at home I have a few questions. The installation had no problems but I can't understand a word of german and am new to TeX. I have got hold of some english docs and can produce simple documents.

Can anyone explain to me how to use the draw.sty correctly, I have manage to include a few pictures in the document but the layout was a mess and I could do with some help in sorting out the parameters required for it.

Also I have heard about Slitex (sp?) and I was wonder what is it, and what to do to get it install on my machine (if I descided to use it) using CS-TeX

Thanks for the help

1071. Output to printer on parallel port question

Newsgroup: comp.sys.atari.st
Date: 1992-01-31 16:17:46 UTC
From: bobhays@spss.com
Message-ID: <1992Jan31.161746.26171@spss.com>
Source record: 226154

I'm writing yet another disk labeller using GEM for my 1091i printer. I'll post the code when I'm done, although I don't really expect many folks to play with it. However, I have a problem.

I cannot get the BIOS or GEMDOS routines to talk to the printer properly. I am loosing info either because the buffer is overflowing or because the BIOS/GEMDOS is not sending binary (non-printing) characters to the printer. If I put enough sleeps into the code, it works, leading me to believe the overflow scenario.

How should one output to the parallel port to such a printer?

I am using Sozobon C 1.33i. I'm exiting out to Gulam shell to execute the GEM program (could that be reseting things badly for me?).

Have fun and an early thank you! - Bob

I've read so many zany solutions to the end of DM, it's quite amusing. (Or at least the first 10 were :-}). You *don't* have to put up 8 fluxcages, and you *don't* have to go into the little room in the corner and fill it with fluxcages! First, kill off most (or all) the demons, they are quite irritating; can't remember if they regenerate or not. Then, do one of the following, which are both straightforward, but the first is *much easier*!

1) Chaos is scared stiff of the war cry! Honest. Put the firestaff/gem in one champion's hand, and nothing in the other 3 (this probably won't work if you have 1 or 2 champions in your party). Stay out of Chaos's direct line of fire, and manouver so you're facing the side wall near where you came out in the open, and at the opposite end of the level from where the small enclosed room is. Make sure Chaos is between you and the side wall, it's not too hard. In the far corner, there are two one-square alcoves in the wall. Have your 3 chars start doing war cries as fast as you can click, one after the other. Chaos will run like hell away from you. If you do it so you are outside of him relative to the corner, in his panic he will run right into one of the alcoves. Run up 2 squares in front of him, do ONE fluxcage, which traps him in the alcove. Step forward into your fluxcage, and fuse him. Boom - game over. I've done this about 5 times in a row, it's real easy.
2) The other good way, although quite a bit harder, involves putting up FOUR fluxcages around yourself, by spinning in place, not moving off your square. Step back *one* square into one of your fluxcages, making sure you are now facing Chaos. He always moves in the direction he's facing, and will often teleport right in front of you in the middle of your cages. Fuse him real quick, and he's toast.

- kn

ps. Too bad the ST version doesn't have war cry sounds! The Amoeba version does. (sigh)

True indeed, Francois Lionet (the author of STOS, for those not in the know) has moved over to the Amiga, but a little piece in ST Format stated that Mandarin *are* going to release STOS 3D - the release data was quoted as either the end of January of the end of February (can't remember off hand)

So there you have it ... it's gonna be released , but heavens knows when :-)

Simon.

Try these suggestions:

1) 16Mhz CPU upgrade

2) 4Megs of memory

3) 21ms < access time hard disk

4) Don't run g++ in the background, under multiGEM or MiNT, avoid
even using these programs if you can.

And of course, you could always buy an SST board, and really burn
some scanning time through your machine.

I recommend an SST-030 16Mhz is cheap but 33Mhz is more realistic.

Hello Everyone,
I'm starting to write my master's thesis and was hoping you guys
there in Germany would know of any document processors that
can read in images as Borland PIC or HPGL files, support both FSM GDOS
and postscript output, and are otherwise solid and user friendly
programs? I know there is no such beast over here, and was hoping maybe
there was such a thing there. A friend of mine from Germany is going
home for a week in February and could pick it up for me. I can read
German, so the docs wouldn't be a problem.
Thanks in advance for your help,
Jim

1081. dbackup v1.22 released

Newsgroup: comp.sys.atari.st
Date: 1992-01-31 21:33:39 UTC
From: dxper@dtek.chalmers.se
Message-ID: <8821@chalmers.se>
Source record: 226174

I have just sent a copy of dbackup V1.22 to atari.archive.umich.edu ...

For those who have not yet used dbackup it is a backup program which can use any compression utility (eg. zoo or lharc) to compress files instead of just copying it. It should be media independent (although I doubt tape drives work with it). Unfortunately some compression utilities do not support storing information such as whether a file is a hidden or system file so all may not work. (most notably arc.ttp does not).

New options:

-y backup only root directory of the source, skipping sub-dirs
-e enable use of extended command lines when calling archivers
-b "batch" mode operation

The new batch mode option makes it a lot easier to use dbackup since dbackup can now be used with more archaic shells or directly from the desktop.

When using the '-b' option you just say:

dbackup -b <userdefined mode>

and dbackup will then search a file called dbackup.inf which has all the definitions on what to do for that particular mode. There is no restriction (except on RAM) on the number of modes a user can define this way. All the options normally available through the command line is available this way.

The '-e' option was added since zoo and others support the extended command line protocol for transfering more than 127 bytes on the command line. This in turn makes it go a lot faster when backing up a lot of files. (it *does* still take some time, though, to backup a 32Mb partition!!)

If you have any difficulties in obtaining dbackup via ftp please let me know and I'll consider posting it to c.b.a.st

A messy-dos version is planned to be released later this spring.

I hope someone finds it useful. I do.

Source record: 226170

Firstly, greg makes the assumption that when a new version of a piece of software comes out, the old version suddenly vaporized. Wrong. People cazn get by just fine with Word 4.0 on the Spectre. I bet that 90% of all Word users, Mac Atari, PC, and Amiga do not use even close to 30% of it's current features, let alone 5.0. Also, It is quite easy to run all those programs under sys 7 with 4 megs. I know, I've done it. You have to change the maximum alotted memory size for each program, which slows them down a bit, but not much, but they still all work OK. Besides Sys 7 has virtual memory, So just get a bigger hard disk. No real caps there. SuperPaint is a memory hog anyway. It works fine when you force it to run under less memory. It is just greedy.

On 31-Jan-92 in ST's memory architecture
user Carter Gregory@cae.wisc. writes:

1087. TOS 1.4 ROM problem

Newsgroup: comp.sys.atari.st
Date: 1992-01-31 23:02:47 UTC
From: tony@microware.co.uk
Message-ID: <807@mwuk.UUCP>
Source record: 226190

Help!

I have just bought a set of six TOS 1.4 ROMs amd tried to install them in my old 520STM (not STFM). They don't work :-(

The ROMs were labelled H0 H1 H2 L0 L1 L2. The original ROMs were not. Looking at my circuit, it appeared that they should go in the following sockets:

U2 = H0, U3 = H1, U4 = H2, U5 = L0, U6 = L1, U7 = L2

where U2 is sort of under the F1 key, and U7 is under the left shift.

Is this correct? When switching on, nothing happens, except the keyboard LED comes on and the screen goes white. I guess the processor has halted.

Just in case, I tried it with the H and L sets swapped, although I didn't try a different order. No change.

i certainly didn't damage the computer, because putting back the original ROMs works OK.

To check that the ROMs are likely to be the correct ones, could someone dump out the first 16 bytes of each pair, so I cam compare?

Thanks in advance for any assistance.

Tony.

> nothing worked.

The problem is a bug in the library used to compile tcsh; the ttyname()
function crashes when called on a pseudo-terminal. A work-around is
to create a symbolic link in u:\dev that points to the appropriate
file name in u:\pipe (i.e. the name of the pseudo-tty). This is the
reason that tcsh doesn't work under MGR, too.

> 3. Tcsh doesn't know the pwd-command. This one should be internal, I sup-
> pose. Also, Tcsh doesn't use the substitute system font from NVDI but
> the ROM font; I don't know what other shells do (forgot to look). Can
> I change this by resetting the console device?

pwd isn't built into any version of tcsh (the ST source code is essentially
the same as the Unix). It's an easy enough program to write -- I'll
leave it as an exercise for the reader :-).

I don't know how to change the font; tcsh just writes to the standard
output, in this case the BIOS console device. It would be possible to
write a new BIOS console that used whatever font one wished, I
suppose.

1093. Modula-2

Newsgroup: comp.sys.atari.st
Date: 1992-02-01 03:03:42 UTC
From: agostino@concour.cs.concordia.ca
Message-ID: <2485@daily-planet.concordia.ca>
Source record: 226180

Hello,

Does anyone know of a good pd or shareware Modula-2 system for the ST? Has anyone used (or is using) the Modula-2 package found on atari.archive (modula2.zoo)? If so, are there any serious bugs?

Any info appreciated. Please use email. I'll summarize if enough interest.

Based on the symptoms reported, I'd try a good memory test program
(MEMTEST.PRG from Supra is a good one) and see if the memory is OK.

One fairly simple thing to try would be to (carefully) remove the
memory SIMMs and reinstall them. (Be careful of the little plastic
tabs that lock the SIMMs in place)

Incidentally.. how do you like the DEKA adapter..? I tried 4 different
IBM style keyboards, and only one would give me cursor keys, and that
one had to be unplugged when booting, or the system went nuts.. what
kind of PC keyboard are you using..?

>thanks for any help.
>james

Without knowing, you have been comparing apples and oranges. So I will give you a brief run-down of all the V.something stuff:

V.22 - CCITT standard for 1200 bps comunication, this is a standard that defines the physical transmission protocol.

V.22bis - same for 2400 and 1200 bps. V.22bis defines comunication at 2400 bps AND includes the V.22 definition as well.

V.42 - this is strictely an error control standard. The V.42 LAPM protocol runs on top of the bit engine (the physical transmission defined by CCITT V.22bis or any other transmission protocol). V.42 corrects line noise problems, before they hit your terminal - and also enhances through-put by approximately 20% (synchronous transmission over the line).

V.42bis - V.42bis includes the V.42 error control and adds a compression algorhythm. Your data will be compressed/decompressed in real time giving a compression ratio of ideally 4:1. In reality, you will encounter anything from no compression (compressed files) to circa 2:1 (raw ASCII).

Your Supra 2400 does not include any error control mechanism, so it is just a V.22bis modem. The V.42(bis) should not concern you, since the remote modem will "sense" that your modem cannot handle error correction and fall back to a plain connection.

Anyway, your problem seems to be at a much earlier stage of establishing the connection: your modem is obviously unable to get a proper V.22bis connection

to the remote modem in question. So it sometimes fails and sometimes gets a V.22 connect. The problem could both be due to your modem or the remote modem. You should check with other people, who connect the server with other 2400 bps modems, if they do not have problems, then you are probably out of luck. Either you have a modem which is "on the edge" or simply a compatibilty problem (not every 2400 modem "likes" all the others...). If other people do have similar problems with the modem of your server, then the university should do something about the modem on their side.

>

Sorry, V.22bis (2400 bps) does not (should not?) work that way. Until the
V.22(bis) carrier is transmitted by the answering modem, the originating
modem doesn`t even know if the line has been established or not. It will
never fall back from 2400 to 1200 bps before it receives and recognizes
the answering modem`s V.22(bis) carrier.

BTW: V.22bis (2400 bps) comprises the V.22 standard (1200 bps) and also
defines the fallback between both speeds (the only time that the CCITT has
bothered to define fall-back procedures at all). There is *no* way, to
prevent a V.22bis modem to fall back to 1200 bps, if the modem decides that
the remote modem is a plain V.22 unit.

Sh***, what I wrote a week ago, *WAS* at that time the most recent information
I had from Gadgets by Small. Only today I learned that Sepctre GCR 3.1,
sheduled for release in *Summer 1991* is actually nothing but vaporware.

Honestly, as a major distributor for the GCR I am pretty upset that I had
to read that news on the net.

>If you read David Small's message he left on the net Spectre development
>is at a STAND STILL, and has been for quite sometime, almost a year I think.
>
In August, Atari Fair Duesseldorf, thus spake Dave Small: "Probably a month
or so..." (until 3.1 is ready).

>Dave has been too busy programming his utilities for his SST board, and
>trying to get the thing out...
>
I know that, and believe me - I do appreciate his work and his products.

>They now are working on a MEGA STE version, which is going to delay things
>even more.
>
News to me - but then again, maybe they really are working on it. Who knows
for sure?

>-Greg

BTW: Why do certain people have no other method of verbal expression
than flames?

From: sigrorn@icemark.uucp
Message-ID: </m89jJDSEyU@icemark.uucp>
Source record: 226189

Hello,

I'm searching for a few CPXs for my ST.

- The first should be a cpx that does the same thing as DJ_ON.TOS does...
- the next one should be able to transmit some settings to my Deskjet
(i.e. set top/bottom/left/right borders, font style/size/quality,...)
- the last I'm searching is a cpx to do same same as xlock on XWindow-
machines (lock-screen and wait for passwd). It should be able to auto-
matically continue its work even after a reset or the next power-on.

Yours
Benedikt

Message-ID: <53802@cup.portal.com>
Source record: 226193

I read in this thread about how holding the right mouse button down
will allow you to launch a program whos folder is not on top. Neat,
but one minor complaint... This is effectivly the same thing as
doing under MS-DOS:

C:/> a:/foo

In other words, if foo needs a startup config file, which probably
lives on a: with foo.[exe|com], it wont find it... I did this
with UniTerm. I had something in A: and UniTerm in B: which was
on the bottom folder, but it couldnt find uniterm.set... OH well

I'm writing yet another Atari story for San Diego's ComputorEdge magazine, and am trying to get a feel for what the most popular software/hardware (keyboards, et al) set-ups are with Ataris. Also, any comments on why you use an Atari for your MIDI rather than a PC or Mac. (I'm not a MIDI user; more DTP and WP than anything else, so bear with me. . . .) As in the past, I will e-mail a copy of the story to everyone who respons (and yes, I know I still owe those who helped with the History of Atari a copy, which I'll get out in the next couple of days.)

Thanks again,

Jim Trageser

I have connected a HD-drive to my mega-2, it works perfectly but I need to change the steprate from 3 to 6 ms. (I use a copy prg. to do that now but I want to do it in a easier way). I dont know where to tell the ST to change it. The only way I have found is to send it with EVERY level 1 command to the fdc. there MUST be an easier way to do this! In short, I am looking for a adress similar to $440 but that also is read by the OP/FDC

1112. Re: Ack! My STe is dying! (dead?)

Newsgroup: comp.sys.atari.st

>Based on the symptoms reported, I'd try a good memory test program
>(MEMTEST.PRG from Supra is a good one) and see if the memory is OK.

Where could I get such a thing? I have the "memtest" that's
available on atari.archive, and everything checks out OK. Before I
moved to San Diego I never had to deal with static electricity - and
I'm thinking that I might not have grounded myself once too many
times...

>One fairly simple thing to try would be to (carefully) remove the
>memory SIMMs and reinstall them. (Be careful of the little plastic
>tabs that lock the SIMMs in place)

I tried this, as well as pressing down on all four socketed
chips inside my computer... I'm afraid that if I have to replace a
chip, it might be a bit expensive because they're all
sufrace-mounted.

>Incidentally.. how do you like the DEKA adapter..? I tried 4 different
>IBM style keyboards, and only one would give me cursor keys, and that
>one had to be unplugged when booting, or the system went nuts.. what
>kind of PC keyboard are you using..?

I haven't really had any problems with the DEKA, except for
the occaisional spurious mouse click, probably due to my overly-long
keyboard cable... I just went down to Fry's (the local potato
chips/memory chips retailer) and bought a M-Tek K104 keyboard (it
has the nice AT layout). For a while I was using an original IBM
PC-AT extended keyboard, which was _heaven_, but unfortunately I was
only borrowing it :-(

>Maarten Vreeken (email: vreeken@cs.utwente.nl)

Since the Uniterm manual is in LaTeX, it should first be run through the LaTeX macros for TeX to convert it to a dvi format. After this, the dvi file should be converted to postscript with the "dvips" program available on the atari archive. Then simply print the post script file.

I don't have a postscript printer or "dvips" otherwise I would have converted it for you.

I fear I am quite well informed. You missed my point. I was complaining
that we, as Atari users, always seem to be resorting to various programs
to correct problems and shortcomings in our machines. If atari regularly
released TOS updates on disk, we wouldn't need:

Quick ST
Gemini
NeoDesk
Pinhead
Little Green Selector
MaxiFile

and on and on and on.

We have a certain number of productivity programs for our STs and about
20 times as many utilities and patches. I suggest Atari makes the atari a
lower maintenance machine and a higher productivity platform?

1119. Re: SM124 Monitor Problem

Newsgroup: comp.sys.atari.st
Date: 1992-02-02 01:01:32 UTC
From: wmagro@roma.uiuc.edu
Message-ID: <1992Feb2.010132.15282@ux1.cso.uiuc.edu>
Source record: 226007

I observer this same phenomenon with my SM124. I am anything but a hardware guru, but I offer the following explanation (and no fix). The sm124 uses a flyback transformer which bootstraps off of the screen current. In simpler terms, the flyback transformer needs to have some return current from the screen in order to work correctly. When the screen is almost black, as with a screen saver, this return current is significantly diminished. This feeds back into the electronics and the electron gun reacts by emitting less current, dimming the screen.

This is of course probably totally incorrect. Some electronics god, please enlighten us.

Help!

Does anyone have any program that I can print out Gif's on?

I have a 520st with a star nl-10 dot matrix printer.

ANYTHING WOULD BE APPRECIATED!

THanks! And please reply via E-mail! ASAP!!!!!

1126. Help needed / TC

Newsgroup: comp.sys.atari.st
Date: 1992-02-02 08:04:22 UTC
From: hohr@cernvax.cern.ch
Message-ID: <9293@cernvax.cern.ch>
Source record: 226019

Hi Atarians,

I've just written a new horizontal hardcopy routine that works fine on a Brother M-1224L. It should work (hopefully) on all LQ500 compatible printers. Hi-rez and mono only. X Y ratio is respected, black is as black as possible.

The 'negative' parts are:
- needs a 128Kb spooler
- takes about 23 seconds on a Mega STE/4 16Mhz+cache
(compiled with MWC)

The idea is to find a kind soul that would accept to compile the source with TC (or Pure C), and send me the result back, so I can measure the time taken in an identical situation.

Thanks in advance for your help.

Please, contact me by e-mail.

Roger hohr@cernvax.cern.ch

1127. Good and small shell for Mint wanted

Newsgroup: comp.sys.atari.st
Date: 1992-02-02 11:43:20 UTC
From: muts@fysap.fys.ruu.nl
Message-ID: <MUTS.92Feb2124317@fysaq.fys.ruu.nl>
Source record: 226021

Does anyone have a bourne shell compatible shell for Mint, that is
quite small? Usually I use bash but sometimes it is too big and
framgents memory too much. It *must* use '/' as path name seperator.

A native bourne or korn shell, without any functional changes from the
original unix version, would be fine.

Thanks in advance,

1128. Bash 1.10 binary for Mint problem

Newsgroup: comp.sys.atari.st
Date: 1992-02-02 11:49:45 UTC
From: muts@fysap.fys.ruu.nl
Message-ID: <MUTS.92Feb2124943@fysaq.fys.ruu.nl>
Source record: 226020

I got my bash 1.10 binary from atari.archive, the Mint version. When I set too many environment variables, the shell crashes.

I cannot set/read the _stksize by the way because there is no symbol table.

Do others have the same problems?

Source record: 226024

There is already one forum that is useful for sharing Spectre
experiences, the AtariPU mailing list.

Or wouldn't you call someone that uses Spectre a serious Atari user?
The AtariPU list is a special forum for people that take the full
advantage out of their ST/TTs... and Spectre definitely does that.

Requests to subscribe are welcome to jartsu@otax.hut.fi (one of my
accounts).

>TT, I would never dare to try PC Ditto.

Sorry, I think you're mistaken...

PC-ditto is nothing but an _interpreter_!

There is really no big difference between, say, a BASIC interpreter and
interpreter for 8086 machine language.

Look:

- There is no need to directly write to hardware registers for
floppy I/O (use the BIOS instead).
- There is no need to directly write to the screen or directly
access the keyboard hardware (use the BIOS conio functions instead).
(It _could_ work even in the new screen modes!)
- There is no need at all to fiddle around with trap or interrupt
vectors.
- There is no need at all to employ timing loops dependant on processor
speed.

There no real reason why PC-ditto shouldn't work on a TT!

If PC-ditto doesn't run on an TT (and it looks that way), the reason
is propably sloppy (or too "clever") programming and "not following the
rules"!

Bye,
Martin [Martin_Koehling @ un.maus.de]

>If you can get it, the February issue of AtariUser magazine (free!) has a
>balanced comparison of PageStream and Calamus.

Which versions?

I have used PageStream 2 and it is up to 10 times slower than version 1.8
Should I upgrade? The main benefit is vastly increased font availability
and more WYSIWYG brought about by using the "Printer Fonts" for the screen
as well.

Note: Even drawing up of graphics is 10 times slower in version 2. Strange.
Maybe the developer had a TT and forgot about us slowboat drivers.

Adam... the Supra MemTest program is 6376 bytes long.. although I guess you'd know if you had it since it announces itself when you run it...

I know it's available on CompuServe, but unfortunately I still don't have FTP access to atari.archive. I could E-mail you a copy if you'd like to try it (and maybe you could send it to atari.archive then).

It's quite a thorough test, although if your RAM passed the other memtest program, that's probably not where your problems lie...

I guess I'm going to have to give Omnimon a call about my DEKA vs. PC keyboard problems (assumming their phone lines don't both still have FAX machines on them) or my review for AIM will end being pretty negative...

> *without* having to take it apart?
>
No... SIPPs and SIMMs are functionally identical.. there's no wayo
determine which is present with any kind of software.

It's EXTREMELY easy to get to the memory on an STe however. Simply take
out the screws that hold the plastic case together, then you can open
a small access door in the metal RF shield to examine the memory. You
don't have to remove the entire shield like earlier models.

If you're concerned about having to break the factory warranty seal,
use the method used by Atari service centers... heat the seal with
a hairdryer until you can peel it off without destroying it... simply
reapply it over the screw when you're done inside...

| I recently purchased a 'previously owned' SM124 monochrome monitor. It seems
| to work quite nicely except for one minor problem. When the display is a
| black background and there is very little text on the screen, the image is
| quite dim. As more characters are displayed the image brightens as if the
| brightness control were being turned up.

I received e-mail from one Ian D. Hawkins who apparently can read this group but not post to it. With his permission I am posting his explanation and solution for this problem...

"It's easy to fix the fading problem. It's caused by the drifting of the cathode supply voltage. This is fed to the card on the end of the picture tube to a connection marked b2. It should stay at 70 volts, but drifts high when the screen is nearly black. the grid thus appears more negative and so the current drops off. Fix it by regulating the 70 volt line with, for example , a couple of 36v zeners in series. They dont draw much current, only a few mA. V2 and V3 are ground connection on the tube-end pcb."

1140. Miscellaneous questions (sorry if frequent)

Newsgroup: comp.sys.atari.st
Date: 1992-02-03 06:24:20 UTC
From: bwhite@oucsace.cs.OHIOU.EDU
Message-ID: <4855@oucsace.cs.OHIOU.EDU>
Source record: 226032

I've been out of circulation for a long time on the Atari world, and I have a whole bunch of questions (well, a few at least) that maybe some kind soul could answer (I've tried reading the newsgroup for awhile but don't have near as much time as I used to). I really appreciate all response. For reference I have a 1040ST with 1 meg, TOS 1.2, a 65MB SCSI hard drive plus an ICD host adaptor, and not much else of note.

1. I've reached my RAM limits trying to do TeX stuff. I saw a file at terminator on how to increase to 2.5 meg using SIPs. Questions: what SIPs should I get, and what the heck is a "veroboard" as described in the article? (Also, just how much is the memory these days?) Any way to get above 2.5 meg?

2. I also need to get a higher version of TOS. I hear 1.4 is no longer the current standard. Will higher versions still work with my 68000 and wimpy 3-bit RGB registers? (I also remember seeing an article on how to build a board to get around 1.6 million colors ... anyone remember that?) Keep in mind I've got TWO ROMS in my board (not sure how many sockets, haven't looked in awhile).

3. Anyone out there ever placed the ST motherboard in a new case? I'd really really benefit from sticking the whole kit and kaboodle in a tower case, maybe put in a new drive, and put my HD there too, and then run a cable for the keyboard (I've already got it pseudo-detatched). This would also let me stick the miscellaneous add-on boards on.

4. Who sells a cable for the ST to Nec MultiSync 3D? A switch for mono mode would be really appreciated. (My current cable if you're curious consists of about nine heavily tinned wires stuck through two pieces of cut-up Tupperware lid for support. The last one used chopped off safety pins. :-))

5. Any hope of sticking a blitter on? Would this really help me? (I mainly use my ST as a terminal. Thus, my next posting ...)

Thanks for your time, like I said it's greatly appreciated. If anyone wants I'll share responses to questions.

1141. uw client VT100 and 4010?

Newsgroup: comp.sys.atari.st
Date: 1992-02-03 06:29:41 UTC
From: bwhite@oucsace.cs.OHIOU.EDU
Message-ID: <4856@oucsace.cs.OHIOU.EDU>
Source record: 226031

Does anyone have a patch to the uw client yet for VT100 (ANSI) and/or Tek 4010 emulation? It seems kinda silly to go to all the effort, just to get an ADM5 (ugh! Horrible use of bandwidth! ew!).

If not, I can probably write the ANSI w_output() routine (I haven't found the input filter yet) if someone out there can integrate it smoothly. It's been four years since I did any AES/VDI programming, and I managed to lose half my backup disks (including the Atari RCS, tho I still have the MW one) in an accident involving a lost disk box and a big motor (don't ask).

As for 4010, that'll be a little more work (to say the least) but I might give it a try. Anyone out there interested in working with someone on it? (Probably over the summer; my schedule is busy for the time).

Here's hoping ...

I don't know if my other post was put up here or not, but I have some additional information on this show. As I said before, the PBS show The Computer Chronicles covered the NAMM show, and focused on Atari in the MIDI field. At least for us in Colorado, it will be showing on Channel 12 February 26th. Perhaps it will be showing the same week, on another day, in other parts of the country. I'm not sure. As far as we're concerned in Colorado, The Computer Chronicles is on Wednesdays at 11:30am, and Sundays at 3:30pm (the Wednesday shows are repeated). For the rest of the country, check your local listings :). This information was in Z*Net. I'm just putting it up here for those who don't get it.

Source record: 226049

```
Hi all,
a new version (2.01) of the game Omega has just been released.
This dungeon-exploration game works on ST's with medium or high
resolution and >= 1 Mb memory.
Main differences from the previous version (2.00): faster, smaller,
a few bugs have been removed.
The game is available from atari.archive.umich.edu
Enjoy! Hildo Biersma
```

|>
|> Billy D'Augustine
|> Azog-Thoth@cup.portal.com
me: First I must say that's (all above) not a problem of TOS
its a problem of these programs, which don't konw the
drive/path which there started from (should be no problem
to find out this 10 lines C I think).

And now to the real point this topic was made for:

What I hate about my ST system (1040 but build into a tower by myself)

- it is tooooooooooooooooooooo slow
(all is to slow screen drawing(even with NVDI), CPU , ...)

- no chance to get things in, except by soldering all over
the big board, a real bus would have been better, BUT
only with strict defines from Atari, because we don't need
those problems like on PC-side ;->

- the keyboard and the mouse (i have an orig. ibm keyboard now
and a logitech mouse now)

What I like

- the good programs runnig on it (Calamus,Script, ..., Turbo C, ...)

- SM124 (a bit small i know)

- it's doing its job quite well, for all I need it

- enough ports from th beginnig (except the bus)

Adio

I don't fully understand this, do you mean that pseudo ttys are in
\pipe rather than \dev, and how should the names look like?

>pwd isn't built into any version of tcsh (the ST source code is essentially
>the same as the Unix). It's an easy enough program to write -- I'll
>leave it as an exercise for the reader :-).

alias pwd "echo $cwd" works for a start, but under Unix it does behave
differently than pwd if there are plenty of softlinked directories. This
isn't likely on a TOS file system, I suppose.

>I don't know how to change the font; tcsh just writes to the standard
>output, in this case the BIOS console device. It would be possible to
>write a new BIOS console that used whatever font one wished, I
>suppose.

Well, NVDI changes the font of exactly this under TOS.

In the /programming section, there is a file called cled122.lzh (or something like that). It's a cassette label editor (`cled'). Intended as an example of programming with GEM, it also looks like a useful application in its own right. Give it a try.

>
>Do others have the same problems?

I'm aware of this problem; I have got a new version which has a visible _stksize, but it doesn't cure the env var problem; bash no longer crashes, but it seems to have difficulty in exporting all of a loong variable list; I notice this most when UNIXMODE gets trashed and the gcc ends up not knowing what the ****'s going on (my gcc lives on a Minix partition).

I could post an updated binary, but you might be just as well to wait for 1.12, which I'll port as soon as I get my SST (there's no way I can compile bash with 2 meg memory :-( ). I'll look into the env var problem at the same time.

Sorry about the **** up; I won't do it again, promise. :-)

1149. Re: SM124 Monitor Problem

Newsgroup: comp.sys.atari.st
Date: 1992-02-03 11:09:02 UTC
From: ate@cs.ruu.nl
Message-ID: <1992Feb3.110902.1076@cs.ruu.nl>
Source record: 226041

Chris Burgess writes:

>I am having a problem with a SM124 (Goldstar) monitor. When the screen is
>mostly black, the white portions of the screen are very dim, and as more
>white is displayed the white return to normal brightness.
>
>Has anybody seen this problem before? Is there somthing I need to tweak
>on the monitor?
>
The answer to this question has been posted in this newsgroup on 15 mar 91.

Ian D. Hawkins writes:
"It's easy to fix the fading problem. It's caused by the drifting of the
cathode supply voltage. This is fed to the card on the end of the picture tube
to a connection marked B2. It should stay at 70 volts, but drifts high when
the screen is nearly black. The grid thus appears more negative and so the
current drops off. Fix it by regulating the 70 volt line with, for example, a
couple of 36v zeners in series. They don't draw much current, only a few mA.
V2 and V3 are ground connection on the tube-end pcb."

And kreymer@fnal.fnal.gov writes:
"I have seen this problem on many monochrome monitors over the last couple of
years. Thank you for the solution to an old, nagging problem. I have installed
the suggested zener diodes on one of my monitors, and the problem has vanished
as advertised. Inspired by this success, I tried a similar, simpler solution.
I have installed a simple 33 kilohm resistor between B2 and ground. It draws
just 2 milliamps, which is enough to keep the voltage between 68 and 72 volts.
The screen is just as stable as with the zeners, and 33K resistors are a lot
easier to find then 72 V zeners. Any value from 33K to 100K seems to do the
job."

I have used the solution with the 33K resistor several times now (we have a
lot of Atari ST computers at our department) and it works.

There is a possibility of getting the *newest* TeX-sources
and the web-files for printers and other drivers:
try to log-in at the anonymous ftp-server at the University of
Stuttgart, FRG: ftp 129.69.1.12 (use anonymous as idendity and your
real name as pasword)
then change into soft/tex or soft/atari where you find a lot of
drivers for different types of printers, computers and lots of macros.
If you don't have any acess to this site: contact the next TeX-group.
There are lots around. Addresses should be availabile in different TeX
and LaTeX books.

Another advice of mine for using TeX in general:
I strongly recomend a harddisc and 2M of memory - this configuration
enables you of using the latest latex-package of Dec 2, 1991 with all
fonts.

A long time ago I posted a fix to this problem. I'm not sure where I posted,
I think it appeared in the Atari16 digests ...

Anyway, I had this same problem and took the (new) monitor to my dealer. The
service person found the problem and fixed it. He also gave me a copy of the
relevant part of the monitor schematics. You have to solder in a resistor
somewhere.

I'll see if I can dig it up and post the info here. If I forget, keep on
nagging until I do! :-)

>an Atari for your MIDI rather than a PC or Mac. (I'm not a MIDI user; more DTP
>and WP than anything else, so bear with me. . . .) As in the past, I will

To those of us who do use MIDI, this shall spark a vivid reaction.
Why Atari and MIDI you ask?

ONE : The Atari computer comes complete with a MIDI interface. This is perhaps the most important reason that software developers chose this computer to develop software for. I can think of no other computer that one cannot buy without a midi interface.
TWO : as a result of the above.. The BEST midi software runs on the Atari ST. (In most cases on the Atari ST alone). Steinberg (German) is the forerunner on midi software. There top product is called "CUBASE". This is by far the best known midi program used by professionals. If you pay close attention to music broadcasts on TV, you should see that, when there is a computer in the background, chances are 90% it will be an Atari, and for the program, chances are let's say 75% it's Cubase. Cubase is shortly to be released for the MAC and PC.
Runner up on the software front is Notator, I believe. This is by a company called C-lab. I believe the programmers of Notator (and other C-lab products) first worked for Steinberg, but later split from them.
THREE : The various Atari benefits like; GOOD SCREEN and LOW PRICE.

What keyboards?

I'm not really into keyboards, but I can tell you something about synthesizers. First, there are more synthesizer/keyboard manufacturers than computer manufacturers, so you can guess the variety of modern electronic instruments is enormous. If asked, I would name the largest three manufacturers of synthesizers as, Roland, Yamaha and Korg. All three offer synths ranging from cheap ($500 is kid's stuff) through intermediate ($1000 to $2000 for the serious amateur or professional) to expensive ($4000 too expensive for home use really). Popular cheap would be Yamaha TQ-5 (or BY 100, I think). Popular intermediate are Yamaha SY-22 (My synth), Korg M1, Korg 01-W (New) or Roland D-10. Expensive synths are Yamaha SY-77 or Roland D-70 (Both top of the range).

Important

It is important to check if you're keyboard/synth is MULTITIMBRAL. This

means it can play more than one instrument at one time. All the above synths are multitimbral (intermediate usually 8 times, expensive synths up to 16 times).

>Bart.

It is this sort of arrogance that annoys me.

People want to use Calamus in the real world. This means that we may want to send our output to printers at work / school or use a typesetter at a bureau.

Calamus' page description language may be superior to PostScript, but everyone else actually _uses_ PostScript.

For this reason, we need proper PostScript on a disk. Telling us that Calamus direct output is better is no good.

Hi,
There is a technote from Atari giving a fix. It seems that this
problem occurs only in monitors from en '87 if I'm right by
hart. I'll check whether I can find any info on it and I'll post
that. The fix is very simple: adding one resistor somewhere in
parallel to a capacitor.
Regards, Louis

Hello:
I have a bunch of clip art files that I would like to use on my
Macintosh. I got them from FTPing an Atari site.

Host terminator.cc.umich.edu (141.211.164.8)
Location: /atari/applications/dtp/clipart
FILE rw-r--r-- 535224 Oct 24 20:56 clipart1.zoo
.... nine files ...

The zoo files are full of "*.img" files. I don't know anything about
the img format so I went to the comp.sys.atari.st news group, found
the Welcome document, and it directed me to the picfmts.doc file.

There I found the img format and its name "GEM". But before I set out
to write a converter, I would like to know if one already exists?

As I said, I would like to have some clip art for my Mac, and this was
the only collection I could find. So I need to convert the img
format into somthing I'm used to working with (ie. have the tools
to work with ;-)

Do you know of any application that will run on UNIX, IBM/DOS, or Macintosh
6.0x, to convert GEM img files to Macpaint, GIF, PICT, or anything else?

Thank you for your time.

1167. C, gem and sound questions

Newsgroup: comp.sys.atari.st
Date: 1992-02-03 23:25:11 UTC
From: wilsont@prism.cs.orst.edu
Message-ID: <1992Feb03.232511.15266@CS.ORST.EDU>
Source record: 226085

I am just starting up with C programming on the ST.
I borrowed the book "Applications guide: programming in C, for the ST" by compute! books.
I'm trying to use Sozobon 1.33i with it. I'm trying to get a gem library up and going but no luck, nothing compiles.
all gemdefs.h and obdefs.h have been changed to gemfast.h .

but the cc compiler gives me crap on most of the lines, even though they are verbatim from the book.

so basically, Does anyone have a C Gem library? does AA have one?

secondly, Where could i find source code for playing back standard sounds? (maybe the source to keyclick.ttp?)

thanks!

1168. FTP

Newsgroup: comp.sys.atari.st

Can some one help me a FTP site, this is the cs.uni-sb.de [134.96.252.31]
is it fully operational.?

All that I can get up to is a date/time line and then it stops/hangs..!!

This has been going on for some days..

Thanks..!

I hereby consider my arm twisted. I will upload the postscript file today.
Btw, I couldn't find the kaos desktop replacement at a.a, so I got it
from a german site and uploaded it sunday. I didn't test the archive though,
so use with caution.

1171. CS_TeX and LaTeX

Newsgroup: comp.sys.atari.st
Date: 1992-02-04 01:50:59 UTC
From: bmw@swanee.ee.uwa.oz.au
Message-ID: <bmw.697168259@swanee>
Source record: 226105

Excuse my ignorance for asking what appears to be a very simple question.
I have just installed CS_TeX on my Mega 4 ST. All seems to work well but since
I can read German I'm having a lot of fun trying to figure out what I have/don't
have in this setup. Could someone please tell me if CS_TeX supports LaTeX
commands in its original distribution? If not how do I set it up so it does?

Also what fonts are missing and/or can I build these using Meta font?

Any help would be appreciated. If you think this is a waste of your time
then my apologies to you for wasting your time.

Thanks
Rob

1172. A couple of UNIXMODE and MiNT questions

Newsgroup: comp.sys.atari.st
Date: 1992-02-04 01:59:39 UTC
From: bwhite@oucsace.cs.OHIOU.EDU
Message-ID: <4859@oucsace.cs.OHIOU.EDU>
Source record: 226119

I have a couple of questions about UNIXMODE (about which I know basically next to nothing except what I read on terminator) ...

1. If I'm interpreting the documentation correctly, extended filenames are stored in an actual file somewhere. Um, ... maybe I'm missing something here, but ... wouldn't it be just as simple to use the unused bytes in the directory (about 31 of them I think)? Or are they reserved?

2. Does MiNT (which I haven't played with either) grok this wonderful system? How about the shells out there? I'd really like to be able to forget that I'm not working on a Unix box. (Yes, John, I know -- I should buy a sparc!)

3. Exactly how slow IS MiNT? Are there any decent accelerator boards out there if it is on the unspeedy side?

Again, thanks for your time.

>(maybe the source to keyclick.ttp?)

Since you're just starting out with C, you're probably not going to
want to have a go at playing back digitized sounds just yet -- it's
fairly tricky and involves assembly language.

Just in case, though, assembly source to play digitized sounds
is in atari/sound/players/resound.arc on atari.archive. The method
used is basically the same as in Digital Keyclick.

1175. How to make a gnu cross-compiler??

Newsgroup: comp.sys.atari.st
Date: 1992-02-04 03:00:23 UTC
From: bwhite@oucsace.cs.OHIOU.EDU
Message-ID: <4861@oucsace.cs.OHIOU.EDU>
Source record: 226109

Yes it's me again. :-) I'm trying to get the most recent gnu C compiler to compile on a Decstation (ghod knows what. I think a 3100), so that it produces a nifty little output file that'll work for TOS.

However, there seem to be no docs, and the Makefile was ... ahem ... less than useful.

So, for a poor ignorant fellow like myself, exactly *HOW* do I get the GNU C compiler to compile so that it's a cross-compiler? For one thing, there is a configuration shell script. What is it for, and how does one use it? What else do I need to do? Where is the default path and such? Please humor me, I've been working on a whitepages service in System V Unix for the past fifteen months. :-)

As usual, email responses preferred. Thank you for your time.

>There are a number of clipart files on a.a that are in ".img" format. How
>do I convert them so that they can be used by EasyDraw (requires ".gem"
>format??

Probably not really possible. .GEM files are metafiles containing scalable
drawing primitives, while .IMG files are raster image files. Conversion the
other way (.GEM to .IMG) should be possible with many drawing programs,
or simply but taking a SnapShot of the easydraw screen.

I have a question about the ST blitter chip. Is it implemented in a dual buss architecture or is it single buss?
IE. Can the cpu continue to run code from a secound buss while the blitter draws, without waiting or alternating access to the buss with the blitter?

- witts@hoss.unl.edu
-

Hi Rick,

I've MWC release 3.0 running on a Mega STE/4. The only problem I had was with RDY (the ramdisk). I think there's a special version of it at a.a. (as far as I can remember). But I work directly with the Hard-disk: it's fast enough for me.

Hope this helps

1183. Spectre leap year bug

Newsgroup: comp.sys.atari.st
Date: 1992-02-04 09:42:22 UTC
From: johnr@cged.co.uk
Message-ID: <1992Feb4.094222.2261@cged.co.uk>
Source record: 225972

Soon into 1992, I noticed the date on my machine (when using Spectre GCR in Mac mode) was a day out. If I set 15th January on the Atari, I got 16th January in Mac mode. A friend speculated this could be a leap year bug, so last night I tried it out, with the following results (European date format):

Atari Dates (dd/mm/yy) Spectre dates

15/12/91 15/12/91
03/02/92 04/02/92
28/02/92 29/02/92
29/02/92 29/02/92 or 01/03/92 (sorry, can't remember)
01/03/92 01/03/92

I can live with this, but people ought to watch out for having two 29th Februarys, or two 1st Marchs, this year if they have any software that uses the date.

What appears to be happening is someone has written a sloppy date calculation algorithm which works like this:

1. Get the date from the Atari and convert months and days to days in year.

2. Check for leap year. If so, add one to the number of days.

3. Convert back to months, days and years.

In the program "Script 2" you can use the
driver for the HP-Laserjet, maybe driver
for the HPLj are avaible in the other
programs. The comand-language of both
printer are nearly the same.

1189. .SPS picture viewer?

Newsgroup: comp.sys.atari.st
Date: 1992-02-04 12:08:04 UTC
From: whitcomb@aurs01.uucp
Message-ID: <60323@aurs01.UUCP>
Source record: 226116

I've come across some Spectrum files that use the extention *.SPS, and none of my picture viewers can handle them. I have no problem viewing *.SPC and *.SPU files, but not *.SPS.

Does anyone know of a viewer that can display these?

1190. Slowing down my TT ... seriously

Newsgroup: comp.sys.atari.st
Date: 1992-02-04 12:45:10 UTC
From: sms@sys.uea.ac.uk
Message-ID: <2135@sys.uea.ac.uk>
Source record: 226115

This may seem a little silly but I want to make my TT run at ST speeds. Not all the time of course, only when running certain programs where the extra speed is a bit of a problem... for example a lot of programs respond a bit too quickly to mouse presses and it's very difficult to increment a value by clicking on an increase button as it goes up in steps of 3/4 unless you're very quick with the button.
Mainly I would like the whole hardware to run slower... I thought of putting in some sort of trace routine purely as a deccelerator but I don't know what side-effects that might cause.
For some things just a slowdown in the refresh rate when using the ST screen modes... for example my demo of Populous 2 runs fine on my TT but at 70 odd Hz ... makes it much harder to play.
I was thus hoping to have a solution before the full game appears (anybody got any date - my local shop is always a bit useless on release dates)

Any info on this subject would be appreciated... hopefully a software solution as I get shaky when using a soldering icon on expensive hardware :-) ... That's why I didn't post it to c.s.a.s.tech (spot the lame excuse!!!... OK, I was on auto-pilot when I started typing this message)

koreth@panarthea.ebay.sun.com (koreth@panarthea.ebay.sun.com) writes:
: In article <92034.111907RIFFEGL@PURCCVM.BITNET> RIFFEGL@PURCCVM.BITNET writes:
: >Can anyone give me a rundown on the capabilities of the Spectre GCR?
: >Does it emulate a color mac?
:
: Not YET...
:
: >What is the speed like?
:
: Well, on a 16Mhz machine its OK. I would never go back to 8Mhz.
: MultiFinder performance is aided greatly with 16Mhz cpu ability...
:
: >can the atari drive read and write normal Mac disks?
:
: Yes that Atari drive can read and write Mac Disks...
: (AMAZING isn't it?!)
:
: >does it use ST memory? if so how much is free for programs?
:
: ST Memory? :) Is there any other kind? Perhaps on a TT, maybe.
:
: But, it really depends on what system you want to use, and how you
: install it...with System 6.0.7 I get about 3 Megs Free.
:
: It also depends on whether or not your under MultiFinder, FInder and various
: inits cdevs you run...
:
: You USE to get enough memory for doing just about anything you need to do,
: using the top of the line programs for the Mac...
:
: NOT ANY MORE. So if you are planning on getting a GCR, wait till the SST
: board is avilable, OR buy a TT and a GCR...
:
: DON'T buy a ST, or even a memory upgrade on it. 4 Megs is really gonna
: suck when we get System 7.0 running.
:
: >
: >Any help would be appreciated.
: >
: >Thanx in advance.
:
: Well your very welcome...
:
: -Greg

The ST does not have enough memory to run system 7 proporly but there is no need to run system 7. System 5 or 6 is good enough and although not as nice as system 7 to use it is not as memory hungry.

In article <1992Feb01.181610.4016@crash.cts.com> trag@pnet01.cts.com (Jim Trageser) writes:
>I'm writing yet another Atari story for San Diego's ComputorEdge magazine, and
>am trying to get a feel for what the most popular software/hardware
>(keyboards, et al) set-ups are with Ataris. Also, any comments on why you use
>an Atari for your MIDI rather than a PC or Mac. (I'm not a MIDI user; more DTP
>and WP than anything else, so bear with me. . . .)

I chose the Atari ST because it had the best price/performance ratio in its class for *any* application (in 1986) and especially MIDI. I still believe this is true for MIDI. Of course, the built in MIDI ports made it attractive as a user, but more importantly, it attracted many developers to the platform. I currently use a Mega ST4 with an SM124 monitor (a must for MIDI). Considering that the software for the ST is still state of the art, I have no reason to switch to another platform. In fact, the new ST Book portable will probably keep me firmly entrenched in the ST market.

I use Dr.T's software almost exclusively. The primary reasons are:
1) They have been in the business for years and have continuously upgraded their software. Sequences I made years ago on my 1040 ST run fine on the newest software.

2) The programs are modular. Dr.T's has developed a "Multi Program Environment" (MPE), which allows many of their programs to run concurrently and share data. Economically, it allows me to build my system a piece at a time, when I can afford each new piece.

3) Support. The programmers are available on-line on GEnie, and provide answers to questions and bug fixes in a very short time. The tech info line is manned five days a week, and I receive upgrade notices and special deals on closeout software in the mail regularly. Since it's a US based company (as opposed to C-Lab or Steinberg/Jones), response time is amazingly fast. Bob Melvin (designer of the Caged Artist patch editors and X-oR universal patch editor/librarian/system exclusive data manager) is especially good in this regard, and has been known to respond to change requests within a two or three days.

4) The software is great. I use the KCS Omega sequencer, X-oR, T-Basic (an interpreted BASIC programming language with hooks into all of KCS's sequence data) and the Phantom (SMPTE sync interface and software). The interfaces are intuitive and the graphics are very useful. Anyone who still thinks that Dr.T's products just fill the screen with numbers hasn't seen them lately! The programs are extremely stable, and I have no problem using them with all of my regular ST system software installed. I recently bought Intelligent Music's RealTime sequencer and M composition and performance tool.

My MIDI hardware setup is hardly state of the art, but it gets me by. I use a Korg 707 (8 voice multitimbral FM synth) primarily as a dumb keyboard. It's velocity sensitive and has aftertouch, and was quite cheap. The sounds aren't great, but I consider them as a free bonus with the keyboard. My main sound modules are the Korg P3 (piano) and Symphony (orchestra). Each are 16 voice multitimbral, and provide me with a limited range of sampled instruments. None of these instruments are new or expensive (I think that all three combined cost less than $1000), but it is important to note that many of the high priced MIDI instruments have built in sequencers and other features which are redundant with my software. I also don't need lots of memory in my synths, as I can store data on my ST using X-oR. In fact, all I look for in a new synth are good sounds, lots of outputs and good MIDI support of the internal functions, so I can usually save money buying the stripped down, small memory rack-mount versions.

I also use an Alesis QuadraVerb GT, a Casio MG-510 guitar MIDI controller and a DMC MX-8 programable MIDI switcher. I've written X-oR profiles for the P3, Symphony and Quadraverb GT.

My next major music hardware purchase will be an 8-track reel-to-reel. I was thinking of buying a Tascam TSR-8, but now that Fostex has worked up a MIDI interface with the ST, I will probably end up with an R8. The press reports from NAMM indicate that this interface will allow complete control of the tape transport via the ST, so you can basically thread the tape and not have to touch the machine for the rest of the session. The fact that Fostex is now working with ST software companies (I believe this interface is available from C-Lab, Steinberg/Jones and Dr.T's) is a great sign for the survival of the ST as a major MIDI platform.

V.22 is not used as a fallback in North America. The older Bell 212
standard is employed; this may be a source of the original poster's
problem.

The only ways to print GIFs that I know of is to convert them:
a) Convert them to IMG and use a DTP program to print
b) Convert to Degas and used IFFCNV to print

There is also a program called GIFPRINT that works on an IBM.
It works very nicely and the results are good/very good.
It also works on PC DITTO (takes 30-45 min to print a 640x480 image)

If you needed a screwdriver, would you instead buy a socket wrench? If you needed a school bus, would you buy a dump truck?

If you must carry PostScript files on a disk to a print shop, then you should buy a page layout program that writes PostScript. Calamus does not. PageStream does. Use the proper tool and perhaps you won't find yourself accusing others of arrogance.

>
> so basically, Does anyone have a C Gem library? does AA have one?

If the compiler is complaining about most of the lines, then you do not
have a library problem. You have a problem with your source code. A small
typographical error near the top of the file can leave the compiler
looking for something that's not there -- a parenthesis, bracket, quote --
as it scans the following lines.

Sozobon 1.33i records its error messages in a .ERR file. When you
encounter a problem like this, open the .ERR file in one window and the .C
file in another window, and move to the first indicated error. Usually the
real problem is one or two lines above the point at which the compiler
first began to complain.

1206. A friend needs some help

Newsgroup: comp.sys.atari.st
Date: 1992-02-04 16:46:56 UTC
From: rene@dvorak.amd.com
Message-ID: <1992Feb4.164656.14745@dvorak.amd.com>
Source record: 226058
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

The following is a letter a friend wrote to me about his computer. He seems to be having trouble with his disk drive controller chip or I guess he could have a bad trace, anyway see what you folks can come up with please. E-mail me and I will see that he gets your informantion.

1040STF

The only thing I wanted to do was install "PC Speed", however...

A little back ground on PC Speed: It is a board mounted (soldered) on top of the processor. The 1040 has at least three different internal designs.

Because my 1040's processor is located below the internal drive, The Atari dealer in Spain suggested I remove the internal drive and extend the cables to place it outside. This was because of the heat generated by the drive. During the installation of the processor jacket (by an AF COM person) [Air Force Communications Tech], a diode or something was inadvertantly burnt out. I then took my computer to the certified Atari Servicing agent in Barcelon (ETEC or ELTEC or something like that). This is were I am at now. The last thing done was the "fix" by the agent in Barcelona.

In the interum, I have bought an external floppy. I can not get it to work on my computer. I have tried it out on a friends 1040 and it does funtion properly.

That is about all. I hope I have given you all the info you need.

Thanks for anything you can do.....

Mikey

>From rene@mozart Thu Jan 16 09:41:42 1992
Well there you have it, like he said anything you can do will be appreciated.

This is a problem in the Star firmware: Occasionally, the 1/360" transport
does not work. This occurs only in 360 dpi mode, you can use the 180x360 and
180 dpi modes just fine.

Get a firmware upgrade for your printer. Christoph wasn't able to find a
workaround and so couldn't make the driver work.

Supposedly, the bug is gone in the firmware of the newest Star models.

1208. Re: The Parallel Port: Speed?

Newsgroup: comp.sys.atari.st
Date: 1992-02-04 17:30:55 UTC
From: glenn@ludwig.sharebase.com
Message-ID: <9202041730.AA24988@ludwig.sharebase.com>
Source record: 226093

While BUSY and ACK may be connected to the interrupt controller, my disassembly of the code doesn't indicate that these signals are activated.

Due to a bug in the Centronics handshaking (STROBE occasionally asserted too long) I disassembled the code and replaced it in my application. I found no reference to interrupts, nor does my replacement code use them.

Basically, after asserting and removing the STROBE signal, the CPU busy loops waiting for the BUSY to be removed.

In my implementation, I exit as soon as I remove STROBE, and do the busy loop on the call to print the next character (where it may get just a bit more parallelism).

If you have information that the interrupt signals are actually used, I would be glad to hear about it, but cannot believe a bald statement without supporting evidence.

GLenn

As the original poster, I think Steve is right here. My Supra modem
says it uses Bell 212 at 1200baud, v.22 at 2400.
By the way, I still haven't been able to get it to work correctly.
I now think that the answering modem is a dedicated 2400 baud unit,
since the 9600 lines are a different telephone number.

Were you remember to "shutdown" xcontrol before changing rez? (I figure you were.)

If I want to get screen shots, I use grabber2.acc, which I got from Atari.archive. (I know it works with TOS 1.4, but I haven't tried it with xcontrol loaded.)

Your ROMS (EPROMS) sound like illegal copies. Atari numbers them U1-U6
and you place them in order as stencelled on the mother board.

Your set, seems labeled from a readout of the Atari Memory space.

There are 6! ways to scramble them. That makes 15 I think.
Write down all the premutations, and try each one.

Remember, you only get to plug one in upside done once. Then its cooked.

Also, if any pin folds under the chip, the whole computer will not work.

Good Luck!

> purchase, so please give any information if you can!
> Any comments much appreciated!
>
I have MWC, and TOS 1.4; an ST, not STE.
The problem is the debugger, which has wired into it:
1. a list of TOS versions (1.4 is not there)
2. a strategy on accessing TOS based on version.

Since the strategy for 1.4 did not change since 1.2, which is there
I just hacked 1 byte to validate 1.4. Works.

To complete the story, the debugger works, but bombs when it exits.
It doesn't not bother me. It might you.

If you are used to the "UNIX" was of compiling, you will greatly enjoy
MWC.

Did you know that PC-Ditto I will output error messages and crash dumps
on the RS232 port. This is how its was debugged.

All you need is to get the terminal port set up under TOS
and hook a terminal (or another ST with a term emulator) to it.
What it prints is useful.

1218. National (U.S.) Magazine Advertises Atari! (see message for details)

Newsgroup: comp.sys.atari.st
Date: 1992-02-04 22:45:57 UTC
From: kllove@uokmax.ecn.uoknor.edu
Message-ID: <1992Feb4.224557.12534@uokmax.ecn.uoknor.edu>
Source record: 226120

First off, I must apologize for the tabloidesque feeling to this article. However, (to me at least) it's like one of those headlines (like 'Elvis lives on Mars with alien mistress!') from the National Enquirer.

I was reading Discover magazine when, to my unbelieving eyes, I beheld that most amazing of sights: a *TWO-PAGE* Atari ad!

'I heard this cry of strangled delight,' said one of his friends (who wishes to remain anonymous). He continues, 'When I rushed into the room, I found him passed out on the floor! After I woke him up, he was incoherent, but just kept pointing to the latest issue of Discover and gurgling happilly.'

Yes, friends, this is what's happening all over the country as Atari supporters are struck unawares by this seemingly benign ad! It has effected so many people that some support groups have been started for those like the poor soul described above. If you know someone similarly effected, please call 1-800-555-HELP for the number of the closest group to your area.

Some of you may wish to know what is in this ad. Well, I must tell you it is NOT for the faint of heart. Skip to the end of this article if you are of that persuasion. Here goes: the first page has a picture of a large screened computer (TT? Mega STe? Nobody in the know of these things has been able to speak after viewing the ad!), a big board with a LOT of switches on it (a super graphic-equalizer?), and this guy manipulating both of them with ease. In a text description below it describes how easy it is to use Atari computers to manipulate stuff (I haven't got the advert in front of me at the moment or I'd be more descriptive. Come to think of it, maybe it's better I'm not. There would be too many computer users accros the country slumped over their keyboards....). Also, included are some of the company/ product names that produce MIDI software. The second page (I didn't pay much attention to this one) was all about the Portfolio.

Well, I hope I didn't scare off too many people with this post. If you feel the need to respond to this message please do it by e-mail. I'm looking for more places that Atari's have been showing up. Side note: I saw T2 and this Atari ad on the same day (Saturday, Feb. 1) and it was almost too much to bear (not really, but it sounds good)!

Sozobon DOES have a C library, it is in 'aesfast.a' and should be set up in your /sozobon/libs directory. When you run cc.ttp, make sure to enter your source file name followed by aesfast.a, so the command line might look like this :

> cc program.c aesfast.a

And of course make sure you include <osbind.h> in the program, I think this will fix the problems, as I have used the AES library fine with Sozobon.

1223. ///_ "Head and Serve" Sozobon HELP! ///_

Newsgroup: comp.sys.atari.st
Date: 1992-02-05 04:23:25 UTC
From: an172@cleveland.Freenet.Edu
Message-ID: <1992Feb5.042325.9188@usenet.ins.cwru.edu>
Source record: 226128

I just recently downloaded the new "Head and Serve" version of the Sozobon C compiler from the atari.archive ftp site. The installation program and GEMENV program helped me a lot, and now I am able to compile C programs without any trouble. Or, as it seemed...

You see, the problem is, the example files compiled perfectly, and the first couple of programs I wrote by myself worked perfectly. I setup a .MAK file to compile them, using the structure in the example .mak files. They still compile perfectly.

I am following the C-manship tutorial to learn C, and I have come to the fourth chapter. I tried to compile the program from the .c program on the c-manship disk and it didn't work.

I am willing to send the .c program file and the .mak file I am using to anyone who is familiar with the Sozobon C compiler and is willing to help me out. If you have a recommendation or want to help, please send me email at mlombar@caticsuf.csufresno.edu or an172@cleveland.freenet.edu. Here are the errors I received:

(After double clicking my c4prg1.mak file, the screen looks like:)

cc.ttp \cmanship\chap4\c4prg1.c -o \cmanship\chap4\c4prg1.tos aesfast.
a vdifast.a dlibs.a (Now it accesses the hard drive for a while, and seems to be working okay!)

```
ld: undefined symbol '_abs' from module .\c4prg1
ld: undefined symbol '_fpltof' from module .\c4prg1
ld: undefined symbol 'fpdiv' from module .\c4prg1
ld: undefined symbol 'fpmul' from module .\c4prg1
ld: undefined symbol '_fpftol' from module .\c4prg1
ld: Unknown symbol of bad symbol type '_abs'
cc: loader failed
make: Return code 1
```

I was hoping that using the command #include <math.h> or another command might help, but it didn't. Also, I did edit out the command #define VOID /**/ which was used later in the program (and I deleted all occurences of VOID) I didn't see a use for it, since it was just a comment without any text within it!

Any help would be greatly appreciated!

>Any information, and I'll gladly bear your children.

It's NVDI, and it is, unlike most screen accelerators, a completely new
VDI (including GDOS), so it's supposed to work with more software than
quick/turbo. In fact, I have no problems with it, except for some older
games, where I have to switch off most features of NVDI using the ACC/CPX
delivered. I have v2.02, however, and people say that up to 2.01 there
were a lot of problems with dirty hacks in some quite standard applications.

No, it's not freeware, the Price is ~ DM 99,- (from Bela Software) and I
don't know if it's available outside Germany. But it is really good.
Very recommended.

1227. All three rez on SM124!!!

Newsgroup: comp.sys.atari.st
Date: 1992-02-05 08:19:00 UTC
From: MORGADO@vxdesy.desy.de
Message-ID: <01GG5L3RVB8GA9MGOV@vax58b.desy.de>
Source record: 225954

I came across a very interesting piece of information
while reading "Your Second Manual to the Atari ST",
by Andreas Ramos. In it he claims that in the May 1988
issue of the German ST COMPUTER magazine a detailed
article appeared describing modificatios that can be
done to a SM124 which allow it to display all three
resolutions!! Presumably low and med rez are shown as
some form of grey scale!

Does anyone have any experience with this project or
a copy of the article which he/she can let me have a
look at?

If this is a feasible project I'll be happy to post
results and info onto the net when I finish it!

I don't know any viewer, but I've come across a doc which describes this
Spectrum Smooshed format (among others). It's somewhere in one of the
popular ftp sites for the atari st called picfmt.lzh ...

Well, you could try writing an accessory that tells GEM to wait for 10 ticks, then return. Then do some useless thing like increment some variables a few thousand times, and tell GEM to wait again. This will SLOW DOWN the machine like you wouldn't believe. Of course, there are a few problems. Mainly, it won't work in TOS programs and it will take up an accessory slot. If you want to be really fancy, you could add an option to change the slow-down factor or turn it off entirely by telling GEM to wait for a selection of the accessory menu-option. This is not the greatest solution, but it will work for you and be fairly easy to accomplish. Hmm, it also wouldn't work with boot disks, since it wouldn't be loaded. If all you want to do (in the main) is slow down the system in general, this should work.

Stephen> ".emacs" but that obviously won't work on the ST.

Don't know about the latest release but with 18.55 it sufficed to
emacs.el in one's HOME directory.

Hope this helps.

> ld: undefined symbol '_fpltof' from module .\c4prg1
> [etc.]

Your 'cc' command line didn't include a reference to the floating point libraries (where modules like _abs reside). The floating point libraries are not part of dlibs or the AES/VDI libraries. You will have to include math.a (or fplib.a -- I don't have my disks at work, so I can't remember the library name) in your 'cc' command line in order to link to this library.

: is propably sloppy (or too "clever") programming and "not following the
: rules"!
:
: Bye,
: Martin [Martin_Koehling @ un.maus.de]

The fact is that if you want a fast program you sometimes HAVE to use "clever" programming.

You think PC-DITTO is too slow on a normal ST but it would be even slower.

You also forgot that the TT has a 68030 processor which is NOT entirely compatible
with the 68000 in particular what operations need to be performed in supervisor mode.

Tos versions below 1.4 are not compatible with a 68030 processor and they were written
with a C interperator!

There's BASH, ksh and tcsh out there. If you run fully on the virtual U:
drive than you can forget about the TOS drive letters :-). As far as I know,
programs which have UNIXMODE built in will work as normal, but it may be
better, if you have a free partition, to reformat the partition using minit
so as to get a Minix partition. and use that under MiNT.

If you've got enough memory and you really want your system to look like a
Unix box, then wait for my init(8) package which includes versions of
passwd, login, getty who etc based upon thier SunOS counterparts :-)

>
>3. Exactly how slow IS MiNT? Are there any decent accelerator boards out

1237. Conmputer Horizons Going Out Of Business!

Newsgroup: comp.sys.atari.st
Date: 1992-02-05 13:37:51 UTC
From: covert@cactus.org
Message-ID: <10371@cactus.org>
Source record: 226097

I just saw a message on GEnie last night that a long time
Atari dealer called COMPUTER HORIZONS, located in Denver
CO, is going out of business. This is very sad news to me.

I lived in Denver CO from 1985 to 1987 and bought many Atari
products there. I used to check out their new ST stuff almost
every weekend. I lost touch with CH when I moved in 1987 but
it is still sad to see Yet Another ST Store Closing.

Another important fact about CH is that the owners were also
a MAJOR distributor of Atari products throughout the West.
So it is a VERY BAD sign to see such a major player in the
shrinking Atari market closing shop.

Any one want to bet on when Atari USA is just a fond memory
to a few DeadHard Atarians?

}is the MAC clock ahead by a full 24 hours???? Is there something that needs
}to be done to "sync" the Atari and the MAC clocks??
}
}Bob Malay

This terrible problem :-) was discussed on GEnie a couple weeks ago... It's
because the Mac uses a different method of storing the time/date than the ST
does, and Dave Small's conversion code has a little hiccough in it... This
year is a Leap Year, and the Mac date will be one day ahead until March 1/92.
Watch for this again in four years if it slips his mind while he's working on
Spectre 3.1...

Summary: Don't worry about it.

Hi!

Does anybody of you have any experiences with the VDI "exchange vector"
services vex_timv, vex_butv, vex_motv and vex_curv? What I don't know is
which parameters expect the interrupt routines that are installed with
these services and what have they got to return.

At the moment, I am writing an AES extension that lets GEM applications
multitask under MiNT. I need this information cause I consider eventually
rewriting the the whole AES event handler (cause AES busy-waits for events and
takes up a considerable amount of processor time).

Thanks,
Michael

>it have its own font? And, most importantly, is it freeware?

NVDI (NewVDI) is a commercial screen accelerator like quick st, but in NVDI the
main part of accelerating is GEM (not TOS outputs like in QuickST). This
doesn't mean, that it is slow in TOS text...
NVDI is *REALLY* fast, especially if you have a blitter chip in your ST; NVDI
is the first program that fully uses the capabilities of the blitter chip!
It has an internal GDOS, too! I can quite recommend it...

Ask your local ST dealer for it, for any closer information.

yours
Benedikt

Here in Germany you can get a program called BCFortran. This is an public
domain Fortran, but I don't know if it is quite good, since I don't work
in Fortran. If I'll find it somewhere on my PD-disk "collection", I'll
send it to atari.archive and tupac-amaru.informatik.rwth-aachen.de .

I just noted yesterday that I had forgot to add the keyword

restrict=<size>

in the manual (ie. the eqvivalent of -r on the command line when defining
a mode in dbackup.inf)

Sorry. (I'll add the missing line and resend it to atari.archive...when I
have the stamina)

> best known midi program used by professionals.

I think you're wrong here, especially the "by far the best known..." bit.
This is way off. Creator/Notator is the best known, much more so than
Cubase. Notator was out several years ago, way before Cubase. The top
Steinberg program when Notator was first out was Pro24, a good sequencer
but not in the league of Notator. Cubase was Steinberg's effort to catch
up with Notator. Then the new Notator (starting with 3.0) added most or
all of the new features in Cubase (like graphical editing, using HyperEdit).

> If you pay close attention
> to music broadcasts on TV, you should see that, when there is a computer in
> the background, chances are 90% it will be an Atari, and for the program,
> chances are let's say 75% it's Cubase.

I disagree. I've never seen Cubase in a print ad or magazine like Keyboard
when they're advertising something else. Also all the band profiles I've
seen mention Notator if they use Atari, and in second place, I'd say
KCS got some mention. Atari's ads for the Stacey all showed Notator.

> I believe the programmers of Notator (and other C-lab
> products) first worked for Steinberg, but later split from them.

Is this a guess, or can you back it up? Included in the Notator 3.1
package is a little mag with bio's of the authors. They mentioned
starting out on the C64 (!), doing well with that, and moving exclusively
to the Atari ST when it came out, etc etc. No mention of Steinberg, they
say they worked as independent programmers. Anyone know which came first,
Notator or Pro24? (Actually, I believe Creator was out well before Notator).

Ah... an easy one. Just add a line to your makefile that sets CFLAGS= -f;
this will tell the compiler to include the floating-point library.

The floating-point library ordinarily isn't scanned for (a) speed reasons
and (b) because it contains float versions of the printf family that are
much fatter than the non-float versions.

> I was hoping that using the command #include <math.h> or another command
> might help, but it didn't.

All that does is include the math.h header file, which defines some constants
and declares the returned values of some of the floating-point library
functions.

> Also, I did edit out the command #define VOID
> /**/ which was used later in the program (and I deleted all occurences of
> VOID) I didn't see a use for it, since it was just a comment without any
> text within it!

With Heat and Serve C, just #define VOID void. The #define VOID /**/ in
Clay Walnum's code is a workaround for a shortcoming of Laser C.
You're going to run into quite a few weird Laser-isms in that code.
Think of it as an opportunity for a learning experience. :-)

Come to think of it, if your makefile defines a complete rule for
generating the executable file instead of relying on the built-ins
defined in MAKE.INI, you'll need to add the -f to the command line
instead of via CFLAGS. You probably ought to add -O as well, so the
optimizer gets a crack at your code.

From: drp9500@ultb.rit.edu
Message-ID: <1992Feb5.182806.19447@ultb.isc.rit.edu>
Source record: 226148

I have two drive mechanisms lying around here that I do not need.

one is a Sony full height mod. OA-D32W-10 double sided (has a 24 pin
connector instead of the 36 pin connector for internals.)

the next one is a Chinnon half height mod. F-353AT rev A single sided.
(has "widebar" eject button)

$15 for the single sided and $20 for the double + shipping.

1257. How combine split lzh files from umich (i.e., make useable)?

Newsgroup: comp.sys.atari.st
Date: 1992-02-05 18:47:50 UTC
From: rkallen@msb.com
Message-ID: <1992Feb5.184750.29847@msb.com>
Source record: 225960

I've requested and received a file from umich mail-server. The file (an LZH file) came in 3 parts. Although I've read through this newsgroup's intro doc. on how to deal with "uuencoded" files, I don't fully understand it.

However, I think I managed to "uudecode" the files directly at the UUCP site I use. But that simply gave me 3 separate .LZH files. *How do I put these 3 parts together so that I can then un-LZH the resulting complete program file*

Replies much appreciated.

> everyone who respons (and yes, I know I still owe those who helped
> with the History of Atari a copy, which I'll get out in the next
> couple of days.)

Reasons I use an Atari:

When I was shopping for a computer a few years ago for music applications, the Atari 1) definitely had the most bang for the buck ("Power Without the Price", eh?), and 2) had the widest selection of MIDI software to choose from (the Mac was close in this regard). The inclusion of built-in MIDI ports was not as much of a factor to me (since you can buy a MIDI interface for the Mac for ~ $50), but is one reason, no doubt, why it has great 3rd party MIDI support. After I bought it, I found that new MIDI software that I wanted (e.g. editor/librarians) usually came out for the ST before other platforms, which made me especially glad I decided on it. And I believe the quality of MIDI software (more on that later) is second to none.

Software:

I use Cubase 2.0 (OK, 2.01). Its "MIDI Manager" allows you to create your own graphic faders (and dials and buttons, etc.) to control most any System Exclusive parameter or other MIDI parameter adn record it as part of the sequence; e.g. set up a bank of faders for volume, panning, aftertouch (timbral changes), effects changes, etc., and I can then control them with external controllers (like my J.L Cooper FaderMaster). Its "Interactive Phrase Synthesizer" can be used to essentially make programmable variations on a musical phrase (random or one of number of other algorithms) that you can use to jam with or as a source for new musical ideas. Two of these phrase synths can be active at once. A "drum map" is there for easily configuring and programming drum parts (can be used for any sound, actually). And you can easily record SysEx from your synths onto a track as well. Its got great piano roll, event, and standard notation editing. In short, its great graphical appeal and ease-of-use make me one very happy customer. I haven't experienced any of the problems others have mentioned (namely, slow and buggy). I'm not trying to say its better for everyone than Dr. T's Omega, just that played a bit with Omega and I'm very happy with Cubase (from Steinberg/Jones).

I also use Dr. T's X-oR universal editor/librarian for configuring and editing my MIDI system as if it were one big synth module. Its not perfect (the envelope editing is missing displays of actual numeric values, a problem on the Atari version which I've been assured will be remedied), but I can't imagine life without it - its editing is very useful, and the librarian is superb.

I also use Dr. T's VZ-Rider ed/lib for the Casio VZ10M, since the editing template for the VZ in X-oR is incomplete. A great, complete editor.

I have a couple of editor/librarians from Steinberg/Jones: for the M1 and the Wavestation. I can't imagine a better graphical user interface. Especially for the newer Wavestation one - its got everything (including little "VU meters" to let you know which patch in a performance is currently sounding and how loudly). They're expensive, but top-notch (and available only on the Atari, as is Cubase 2.0 currently).

And very importantly, I use the Revolver partition switcher to be able to simultaneously switch between Cubase, X-oR and VZ-Rider. I'm very impressed that I can use it with some non-GEM programs (like Cubase and VZ-Rider), and that I can "roll in" pre-booted programs (I use it to load in a state of X-oR that already has all my favorite banks loaded). Unlike the M-ROS multitasking operating system that comes with the Steinberg products, it has no problems with desk accessories, and can be used with most other non-Steinberg non-GEM programs OK.

Hardware:

Korg Wavestation Ex, Prophet VS, Korg M1R, Casio VZ10M, Lexicon LXP-5, Alesis Quadraverb+, JL Cooper FaderMaster, Roland M160 mixer, Korg MIDI patch bay, and 1040ST

>Are you saying that we must stick to postscript for the rest of time?

Not at all. What I objected to was the "Calamus is so great I don't see why you should even consider using anything else" argument. I stated why we might want to have Postscript output.

If the Calamus Page Description Language becomes as popular as Postscript, I'll be happy -- by all accounts it's a better PDL. But although Calamus could output _both_ Calamus PDL and Postscript, you _still_ have to buy some other program to do the conversion.

I'm not saying that we should stop using the Calamus way of things, just that the great thing about standards is that they are just that : _standard_.

This is not to say that we should never innovate (I hope to god someone innovates us out of the IBM-PC standard soon). When you could support a very popular standard at little extra cost, but refuse to do it because you consider it beneath you, that's arrogance. What other serious DTP program takes this stance?

The drawing program "MVG" can apparently handle .IMG files of an size (that
can fit into your memory) and can import .GEM files scaled to any size. I
have no idea how to get hold of this program - this is second handle info,
but if noone knows, I can chase it up.

1265. FOR SALE: 520ST, 2.5meg, TOS 1.4,MEGAFILE 30, 2 MONITORS ect.:

Newsgroup: comp.sys.atari.st
Date: 1992-02-06 04:06:27 UTC
From: ebowen@ub.d.umn.edu
Message-ID: <2557@ub.d.umn.edu>
Source record: 225962

I have a dead Atari 520ST system for sale complete, or to part out. I will
sell all by March 1st to the highest bidders (no price too low).

520ST (rev c board) with 2.5 meg Z-ram board (flaky)
TOS 1.4, ST time internal clock
(this works occasionally - hardware hackers only)

Color monitor
Mono monitor
Single side drive
Double side drive
Megafile 30 harddrive

I BELIEVE that everything except the CPU is in working order, but
things were getting weird as the CPU got flakier, so there may be other
problems. (If you can't get something to work I'll give you your money back).

> Does anyone out there know of a PD fortran compiler, or have a commercial
> version they'd be willing to part with?

the GNU project is working on a fortran compiler, tho i have not tracked its progress for several months. i would expect it to be "typical" of GNU software: very functional (feature-rich), frequently updated, produce good code (optimizer), highly portable (relative), huge memory/disk hog, free.

a port to the ST would be eased by the availability of gcc (GNU C compiler) and library, though it would more than likely be non-trivial anyway. it would be interesting to find out where this project currently stands, especially with availability of h/w accelerators on the ST and in context of the TT.

another option is to consider using f2c (fortran-to-C translator). it spits out C code. i thought i read about a port to ST recently (upload to a.a?). f2c is rather large, but should port fairly easily nevertheless. gcc should be able to handle the f2c "output". i have used f2c on other platforms with reasonable success. note that f2c output is far from pretty, tho it usually compiles without modifications with reasonable C compilers (gcc fits this category).

For Xcontrol is a CPX-modul avaible which change the steprate.
I think you can get it in atari.archive .
For the AUTO-folder it gives a program which is called stepxx.prg.
This program get the information aout of the to numbers which were written
in th position of the two 'x'. This program is from Claus Brod and a part
of his book 'Scheibenkleister II, Massenspeicher am Atari ST' but i think
it's not a PD-programm.
Maybe Claus read this too, i think he read this Newsgroup too, and he can
tell you more about the Program stepxx.prg.

```
You have to use initex first to get latex.fmt.
To preload formats use %format latex as the first line of your
tex file.
Using Metafont is easy.
If you have a big, big harddisk and some nights of
you can run the computer:
click c_MF.prg
select your printer
choose all fonts
and run and wait
do this again for the other magnifications. You will need
about 1 Meg and 12hours for each magnification.

Otherwise:
take some documents you want to process
compute the dvi-files (can be done outside, if they exist)
choose "fehlende erzeugen" (on the right were tex is called)
this creates a list of the used fonts.
run c_mf.prg
select your printer (don't forget that)
and choose "liste erzeugen". This creates the font needed
```

You could also hook a routine into the VBL queue which wastes time. This will work with all programs, assuming that you can install it before you run the target program (may not be easy for games).

I guess storing extended filenames in unused parts of the directory entry
would be a good idea, except it would require very lowlevel operations to the
file system, which is not desirable, since the file system might change in
the future (maybe larger partions).
Also you will have to have any application that manipulates file to use this
extension, because programs might get confused otherwise. For example a simple
desktop copy of files will remove any extended name.

Another much more usefull extension of names would be to use a completely
different file system e.g. minix which is supported by MiNT. (This might have
the same problem with programs not knowing about it, but the solution seems
to me to be much more elegant).

> 2. Does MiNT (which I haven't played with either) grok this wonderful system?
> How about the shells out there? I'd really like to be able to forget that
> I'm not working on a Unix box. (Yes, John, I know -- I should buy a sparc!)

Since MiNT and some shells are compiled with GCC, they will probaly use the
system. Also other programs like ZOO if GCC-compiled.

Because that would require someone to write a new filesystem (or most of one, anyway), that did the low level disk access. The file method lets the C library do the work without having to muck about with the disk on a sector basis.

In article <bmw.697168259@swanee> bmw@swanee.ee.uwa.oz.au (Robert Woodcock) writes:
>[...] Could someone please tell me if CS_TeX supports LaTeX
>commands in its original distribution?

Yes, it does. You have to create a LaTeX format first. This is not really a question about CS-TeX, but TeX in general. Try and get a book or ask a local LaTeX guru to help you a bit.

To create a LaTeX format, just select 'Make format' (or whatever it's called in the english version :-) and click on LATEX.INI. CS-TeX does the rest.

>Also what fonts are missing and/or can I build these using Meta font?

There is only a minimal font set included for the more common printers. If you start from scratch, I would suggest to create only the missing fonts you really need. The driver produces a list of these fonts, and you only need to select this list in the Metafont shell.

There is a program called GEMVIEW that will display all manner of picture formats including .GIF, .GEM, .IMG , SUN rasters etc.... Any picture that it displays can be converted and saved as a .IMG. I've no idea whether it can give you a .IMG of 300dpi cos' I've never tried.

Its a nice program though, works in ALL resolutions I believe, should be available somewhere on terminator.cc.umich.edu in the /atari directory..

...offhand I can't rmember exactly where I got it from.

Hope that helps.

1278. PageStream 2.0 Info Wanted

Newsgroup: comp.sys.atari.st
Date: 1992-02-06 13:13:43 UTC
From: Bill_von_Hagen@TRANSARC.COM
Message-ID: <kdYHG7j0BwwuM8mNc1@transarc.com>
Source record: 225970

Could some kind soul send me the address and phone number of the company that markets PageStream (Soft Logic?)? Also, could someone send me the address of a mail-order house that still sells ST software (specifically, PageStream) at a "reasonable" price?

I use PageStream at home for a variety of personal projects, and have found it reasonable to work with. I currently have version 1.82, and am considering upgrading. Can anyone tell me if 2.0 has added separately-adjustable inter-paragraph spacing (tweaking the line spacing isn't good enough). Also, is the redraw still pretty slow? In PageStream 1.82 (and several earlier versions) on my 2.5 MB TOS 1.0 ST, every time I scroll the window, there's a top-to-bottom redraw that is fairly painful - it actually appears to be reflowing all of the text on the current page.

Of course, if anyone has a copy of PageStream 2.0 that they're interested in getting rid of, please let me know.

Thanks!

Bill (wvh@transarc.com)

>The following appeared on ST MAGAZINE No 57, JANVIER 92:
>
>" Le Protracker est un soundtracker tres complet pour un freeware..."

This is _not_ correct. I've spent far too much time on ProTracker
to release it as freeware. The copy of ProTracker that's floating
about was stolen, and should never have gotten out.

>Has anybody seen this protracker ? The screen shots look really nice
>and can load PACKed files (save disk space). Is it available on any site?

There is (should be) a demo copy of ProTracker ST v1.3 on a-a. Take a
look at it - v1.3 is a lot better than the illegal copy (v1.2) that's
gotten out. ProTracker itself is going to be released commercially
under Daatasoft pretty soon.

Source record: 225983

I thought some of you might want to know how fast the TT was as compared with other "workstations" using a real application.

This is the result of running Rayshade Version 3.0 (no Utah raster toolkit) on a Sun SPARCstation IPX (16Mb RAM) and on an Atari TT030/8.

The Sun took approximatly 300 seconds to perform the raytrace of two mirrored balls in front of two mirrors at 45 degrees with a textured floor. The TT took approx 1700 seconds to render the same image.

On the Sun, rayshade was compiled using dynamic libraries, the standard Sun C compiler with the -O switch.

On the TT rayshade was compiled with GCC 1.40 and mintlib16. The following switches were used:-

```
-O -fstrength-reduce -finline-functions -fforce-mem -fforce-addr -m68020
-m68881 -D_M68881
```

The define -D_M68881 was used so that the inline assembly functions to use the maths co-processor in the PML math.h header file were used.

The executable was set so that it would run in TT RAM and could also Malloc() from it.

The code was run under MiNT 0.92.

As you can see, the TT performance was about 1/6th that of the Sun IPX (SPARC 2 chip running at 40MHz(?)). As raytracing is VERY floating-point intensive, this suggests that the TT's floating-point performance is about 0.5 Mflops (The IPX is rated at about 3 Mflops).

I don't know what this proves, if anything, but there you are!

I believe GEM files are vector graphics go it would be rather difficult
to covert IMG (bit image) to GEM.

1284. TT speed comparison..

Newsgroup: comp.sys.atari.st
Date: 1992-02-06 16:36:02 UTC
From: ucacmsu@ucl.ac.uk
Message-ID: <1992Feb06.163602.212878@link-1.ts.bcc.ac.uk>
Source record: 225982

I thought some of you might want to know how fast the TT was as compared with other "workstations" using a real application.

This is the result of running Rayshade Version 3.0 (no Utah raster toolkit) on a Sun SPARCstation IPX (16Mb RAM) and on an Atari TT030/8.

The Sun took approximatly 300 seconds to perform the raytrace of two mirrored balls in front of two mirrors at 45 degrees with a textured floor. The TT took approx 1700 seconds to render the same image.

On the Sun, rayshade was compiled using dynamic libraries, the standard Sun C compiler with the -O switch.

On the TT rayshade was compiled with GCC 1.40 and mintlib16. The following switches were used:-

```
-O -fstrength-reduce -finline-functions -fforce-mem -fforce-addr -m68020
-m68881 -D_M68881
```

The define -D_M68881 was used so that the inline assembly functions to use the maths co-processor in the PML math.h header file were used.

The executable was set so that it would run in TT RAM and could also Malloc() from it.

The code was run under MiNT 0.92.

As you can see, the TT performance was about 1/6th that of the Sun IPX (SPARC 2 chip running at 40MHz(?)). As raytracing is VERY floating-point intensive, this suggests that the TT's floating-point performance is about 0.5 Mflops (The IPX is rated at about 3 Mflops).

I don't know what this proves, if anything, but there you are!

1286. Re: The Parallel Port: Speed?

Newsgroup: comp.sys.atari.st
Date: 1992-02-06 17:47:55 UTC
From: glenn@ludwig.sharebase.com
Message-ID: <9202061747.AA07593@ludwig.sharebase.com>
Source record: 225977

My congratulations to elendir@inf.enst.fr for having a TT.
Although my disassembly was initially done on a 1040ST, I examined
Rainbow TOS when it was made available and the printer code was still
the same.

I now have a TT, also, and must admit I haven't re-disassembled the code
on it. On the other hand, my rewritten printer driver is working on the
TT quite successfully, and I would suspect that if printer interrupts
were enabled, there would be a bit of confusion between the printer
interrupt and my printer driver. I freely admit this isn't proof of
anything about the TT, and that the interrupt lines probably exist on
the ST as well as the TT: any company with plans for a multi-tasking
OS would have to supply the hardware capability for interrupt driven
printing--but would not have to use it in their single-tasking OS...

I'll have to check out the TT printing code when I get the time, see if
Atari ever did fix their bug (which I reported in 1987).

GLenn

1287. Circuit drawing programs?

Newsgroup: comp.sys.atari.st
Date: 1992-02-06 17:48:06 UTC
From: dinsmm@aix02.ecs.rpi.edu
Message-ID: <n2asjtj@rpi.edu>
Source record: 225976

Greetings.

I am looking for a program that can draw circuits. It doesn't
have to be specifically designed just for electronic cicuits,
but it should be easy to use and not labor intensive just to make
the diagram.
Is there anything out there that does that? Commercial or PD or
Shareware? Any details would be greatly appreciated. Thank you.

You must be joking. Since the indroduction of IBM PCs, DTE-type serial
ports have always been male. Look on your modem (if you have one). Most
likely, it has a female DCE-type connector. Perfect fit, eh?

[In article <697322022.24866@minster.york.ac.uk>,
mjl-b@minster.york.ac.uk writes ...]

> What I objected to was the "Calamus is so great I don't see why
> you should even consider using anything else" argument. I stated why we
> might want to have Postscript output.

I think anyone who advances the argument that Calamus is the be-all,
end-all of page layout software is ignoring the fact that users' needs
come in many shapes and sizes. There is no one perfect tool, and there
never will be.

> If the Calamus Page Description Language becomes as popular as Postscript,
> I'll be happy -- by all accounts it's a better PDL. But although Calamus could
> output _both_ Calamus PDL and Postscript, you _still_ have to buy some other
> program to do the conversion.

Point of clarification: PostScript should not be regarded as a page
description language. It's a programming language designed for building
graphic images. There's a very big difference. You can't create a page
with PageFoo software, write out a .PS file, then edit that page with
PageBar on a different platform. You can use the .PS file to build a
bitmap on a system (usually a smart laser printer) that has a PostScript
interpreter, but that's about it.

Calamus doesn't output a programming language. It outputs a bitmap in a
format appropriate to the imaging device that is being driven. This allows
it to skip several layers of interpretation, resulting in faster
throughput. It also allows Calamus to have very precise control over the
output image, something that is not possible with PostScript.

> I'm not saying that we should stop using the Calamus way of things, just that
> the great thing about standards is that they are just that : _standard_.

As Henry Spencer says, the great thing about standards is that there are
so many of them.

> This is not to say that we should never innovate (I hope to god someone
> innovates us out of the IBM-PC standard soon).

That was accomplished years ago.

> When you could support a very
> popular standard at little extra cost,

Whoa! Who says it would entail ``little'' extra cost? Have you priced
Calamus recently? Those modules don't write themselves.

Of course it would be possible for the authors of Calamus to create a module that could write PostScript code based on Calamus' document file format or internal data structures. That doesn't mean it would be simple, easy, or cheap, or that the performance would be acceptable to the market at which Calamus is aimed.

> but refuse to do it because you
> consider it beneath you, that's arrogance. What other serious DTP program
> takes this stance?

I know of no instance in which Ditek has said it considered PostScript support ``beneath'' it.

At any rate, businesses make decisions on the basis of projections of short-term and long-term profitability, not on emotional grounds or ``arrogance.'' If it becomes clear that there's profit in PostScript support, even at the expense of siphoning off scarce resources from other projects, then no doubt you'll see PostScript support.

I don't think it's all that clear. There are some serious competitors to Calamus on the way from other developers who are taking a similar approach -- i.e., focusing on high-performance page output by rasterizing the image directly and avoiding PostScript entirely.

If I ran the company, I'd be very careful not to get blindsided in my upscale core market while working on a product that would be of interest primarily to people who can't afford a printer.

One other comment: The performance issue may be small to you, but to others it is very, very important.

The company I work for -- a major daily newspaper -- must typeset thousands of 18-by-22-inch pages per week. Most of those pages are dumped to the typesetter in a very small time window, close to the press deadline.

PostScript simply cannot handle the job quickly enough, so we continue to use Autologic APS-5 typesetters whose design is a couple of decades old. We can RIP, record and process (photochemical, resin-coated paper) a broadsheet newspaper page at about 2000dpi resolution in a few minutes. Even the fastest new RISC-based PostScript RIPs can't approach that sort of performance.

We're stuck with PostScript on the Macintosh systems used by our infographics specialists. Whenever we must output an infographic on deadline, there's a great round of nail-biting, and often we miss the start of the press run with the color separations. For businesses with our sort of time constraints, the internal-RIP model used by Calamus makes a lot of sense. For the casual user who doesn't own a printer, it's probably not the best solution. Pick another tool.

But don't expect it to be perfect. As Voltaire observed, we live not in the most perfect world, but rather the most probable world.

>
>MiNT slows down an ST by about 10%. On my TT.. it's not noticable :-).

I'd have to disagree with this. To quantify MiNT's overhead, you need to specify what operations are taking place. Kernel (OS) calls are certainly more expensive, but general CPU operations are slowed to a much smaller extent. Using qindex, I have seen a 1 to 2% slowdown in CPU performance on my 520stfm. Screen operations are affected more by low-level pixel routines than the OS. I also doubt that disk I/O could be slowed appreciably compared to the hardware performance. In summary, MiNT overhead for most operations is unnoticable; the main slowdown I have seen is in screen text operations and that is rapidly improving with each MiNT version.

I've had EASYDRAW highly reccomended to me for this use. A set of
circuit elements is available (I hear) for cutting and pasting!
EASYDRAY is as the name implies "easy to use" but it's not
simplistic. It is a capable program.

I do not use it for this purpose as I've been too busy to get it and
set it up....

In article <60323@aurs01.UUCP> you write:
>I've come across some Spectrum files that use the extention *.SPS...
>
>Does anyone know of a viewer that can display these?

There should be a file in the atari archive called "SPSLIDEX.PRG" that should be used to view these files. Actually, this program will compress spectrum .SPC or .SPU pics, hence the .SPS (smaller? scrunched?) extension so that .SPS are usually smaller (about the size when you arc .SPC files.) NOTE: you might come across some .SPS files which are actually animation done in Spectrum 512 format with the program Unispec so don't try any use the slide show on them.

I know it isn't exactly what you're asking, but I've got a copy of PC Board Designer. It is selling for around $50 & I just wanted to comment it's not the easiest thing to use. You really need a mono monitor & a printer that has 1280 dots across.

1298. More RAM!

Newsgroup: comp.sys.atari.st
Date: 1992-02-07 05:57:51 UTC
From: Azog-Thoth@cup.portal.com
Message-ID: <54108@cup.portal.com>
Source record: 225997

(please pardon the wide distribution, but since there seems to be quite an active Atari community in Germany, I figgered I might get an answer from there as well as from the US)

Ive got a 520STe with 4mb of RAM, and I want more! I know that there are some accelerator cards for the non-STe, which also offer additional RAM, but since these dont work in the STe, and basicly I just want more memory, thats not a viable option for me.

I dont know anything about the ST architecture, but I am quite well version in electronics and theroy, and a bad speller at that. But what would happen if I plugged in say 4mb SIMMs into my STe? Would I be able to access that extra memory?

Im sure that for some reason its built to limit to 4mb (Atari foresight) but theres gotta be a way? Considering that the 68000 is capapble of addressing somewhere in the range of 4gb? (sorry if that number is wrong, but I dont have specs with me)

I dont mind taking a soldering iron to my machine, if thats what is needed (In Ataris mind, my warrentee was voided about three days after I received shipment, to install the 4mb...)

Thanx

Billy D'Augustine
Azog-Thoth@cup.portal.com

BTW: has anyone recived TOS 2.06 from CodeHead yet? I am getting quite itchy, and if need be, to satisify my upgrade addiction, Ill do something to my Amiga :-)

1299. Two ST questions

Newsgroup: comp.sys.atari.st

From: rjung@aludra.usc.edu
Message-ID: <kp49t7INNk8e@aludra.usc.edu>
Source record: 225992

Two oddball questions. Please e-mail replies if possible.

1. Does anyone know if FSM GDOS will have/already has some kind of "FSM GDOS Font Creator" utility? I want to get FSM GDOS when it comes out independently, but would also like to know of any way to make my own (scalable) fonts. Is Atari Corp. planning on releasing such a tool to the public for an extra price, perhaps?

2. I'm interested in finding an object-oriented drawing program. Preferably similar to MacPaint II on that fruity computer, and capable of running on a color monitor. The last such OODP I saw was EZ-DRAW, but it was a while ago, and lacked a few refinements I wanted to see (locking objects on a page, drawing pictures greater than one page in size, etc.). I don't have enough information on the newest German art programs -- anyone know more?

Thanks in advance,

> plate@cdsmn.mn.org

f : means internal floppy drive in the CPU box.
m : modulator installed (i.e. can hook up to the TV etc.)
STe and Mega STe are newer ST and Mega with enhancement in it also use SIMMs
instead of DIPs on older machine.
TT is 030 machine with different design for more expansion.
STs has no expansion slot, Mega has one Mega bus for expansion, Mega STe has
more and TT has VME bus.
The STs requires hardware hacks to add-in (piggy back, remove etc.) or use
DMA (hard drive, supercharger) or cartridge port (Spectre).
STe is about the same except the memory upgrade is easier (change the SIMMs).
Other probably can provide more information on top this and correct any
mistake presented.

The name of the library you must include is fplib.a. You include
this library through a -f (or -r?, i remember it is -f) in the
comand-line of the cc comand.
I think then it will be correct translate.

bye..

Hi People,

I'm posting this for a friend `sans network access', so please email any replies to me. Thanks. My buddy would like to know what the printer support is like for C-labs Notator package. He's looking at Epson-compatible printers and has also been somewhat taken by one of the Canon Baby-Jets. He would particularly like to know of anyone's experience of printing scores in landscape format.

Many thanks in advance from Rob (and myself).

Cheers,

.IMG files are bitmaps; .GEM files are metafiles. (That is, .IMGs are
pictures while .GEMs are essentially VDI commands strung together.) It
is not a trivial task to convert from IMG to GEM (other than brute
force, of course, by plotting each pixel). The Codeheads market a
product called Avant Vektor which will do it (and do it well, so I
heard) but unless you're a serious DTP user, I doubt if it will be
worth it.

1304. Problems when trying to exit MiNT

Newsgroup: comp.sys.atari.st
Date: 1992-02-07 10:01:57 UTC
From: "Carsten Menke"
Message-ID: <1992Feb7.100157.14008@unibi.uni-bielefeld.de>
Source record: 225999

I have got a problem when I try to leave MiNT.

If there is a program running in the background (like lpd), when one
trys to leave MiNT the system prints this message:

pid 0 (MiNT): assert(`f->links == 0') failed at line 590 of filesys.c.
Fatal MiNT error: adjust dedug level and hit a key ...

Hitting a key leads to:

System halted Press 'x' to exit, or else reboot

After pressing x the first messages once again will be printed.
Pressing any other key or combination of other keys causes the 2nd
message (System ...).

Raising the debug level seems to be no help because there is only difference
between the regular leaving of mint and the crash:

Crash:
pid 1 (sh): Fcntl(-1,cmd=0x5407)
pid 1 (sh): Fcntl: calling ioctl
pid 1 (sh): Pterm(0)
pid 0 (MiNT): leaving Pexec with child return code
pid 2 (lpd): disposing of closed fifo <---- difference for the crash
exit code: 0
pid 0 (MiNT): assert(`f->links == 0') failed at line 590 of filesys.c.
Fatal MiNT error: adjust dedug level and hit a key ...

Reagular leaving:
pid 1 (sh): Fcntl(-1,cmd=0x5407)
pid 1 (sh): Fcntl: calling ioctl
pid 1 (sh): Pterm(0)
pid 0 (MiNT): leaving Pexec with child return code
exit code: 0
leaving MiNT

Is there a posibility to solve this problem ?

Not 'rm u:\proc*' or manual killing of background jobs.

The system I am working on is an ATARI MEGA/STE 4MB.
Unfortunatelly I do not know the TOS version I have,
because up to know everything works fine.

I have not mounted any other filesystem.

1305. STE memory upgrade - hard luck story

Newsgroup: comp.sys.atari.st
Date: 1992-02-07 10:08:21 UTC
From: pete@btcase.bt.co.uk
Message-ID: <1992Feb7.100821.22414@btcase.bt.co.uk>
Source record: 225902

My thanks to those that responded to my post last week about SIMMs and SIPPs.

I braved the internals of my machine to discover my 1Meg soldered to the motherboard. SIMMs I could upgrade, this means a trip to the workshop :-(

When I purchased my machine, I was under the impression that all STEs had SIMM memory. This was part of the reason for choosing it over the STFM.

If I add the worries I have over my DMA chip, which may yet scramble any (sorry, non Atari) hard disk I add to my system, I think I will have contributed my "2d" to the "No flames - things I don't like about my machine" thread.

1306. STDCAT 5.0b fails on disk volume renaming: ROOT DIR Destroyed

Newsgroup: comp.sys.atari.st
Date: 1992-02-07 10:47:47 UTC
From: ralph@laas.fr
Message-ID: <RALPH.92Feb7114747@orion.laas.fr>
Source record: 226000
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I ran STDCAT50 under GULAM on a Mega 4 ST with TOS 1.2 and
with PINHEAD21 installed. I was surprised at the following behavior
since STDCAT 4.3 worked *so* well. It might be my configuration. It
might be STDCAT.

The night before last I decided to catalog some new unlabelled
disks. In order to control the order of the new disks I turned off
the disk sort field. That way, when I added a box of disks they would
be stacked at the front of the disk list, last disk added being first!
(This is a slight inconvenience.) I was using the MULTI option of
ADD.

I then went through the DISK NAME menu, also with the MULTI
option. I would go through the same box except this time in backwards
order. I specified Update Volume on Disk! Everything went fine in
the database. But last night, when I looked at some of the disks
there were two problems:

1) When I specified a disk name of SOZOBON.001 I would find on
the disk (with VOL.TTP) only SOZOBON.

2) Furthermore, the root directory of *ALL* the disks except the
first one were COMPLETELY DESTROYED! ALL THE DISKS HAD THE SAME
ROOT DIRECTORY AS THE FIRST DISK! I am at a loss as how to recover
the files, as only the directory has been wiped. The problem would
also happen when I renamed existing disks!

Also, any suggestions for recovering the files? Any tools for
rebuilding the root directory?

Thanx Bill!

Bill> "Why my Atari 1040STf Sucks," by Bill Magro

Bill> I) GEM/Desktop has a lot of problems
Bill> A) Mouse events are not registered quickly, so if I click on a button
Bill> and quickly move the mouse, the button doesn't see the click. Very
Bill> annoying, and it slows me down.

I have the *exact* same problem on my sparcstation at work running
X11R4 and OpenWindows 3. I can quite easily click and move too fast
for the X11 events and the machine does the wrong thing. Sometimes I
even get it to freeze up completely and have to reboot (or kill X11).
Seems just like when some interaction of GEM programs misbehaves,
isn't it.

Bill> B) I have to bring a window to the front before I can launch a program
Bill> from it. In the mac's finder, if I double click on an icon in an
Bill> obscured window, the window comes forward and the program runs. In
Bill> GEM the window just comes forward. Arghh! This slows me down.

A correction seems appropriate! Holding the right key while double
clicking *will* run the program in the other window with the current
top window serving as current directory. This has been true since TOS
1.0 but seems to be undocumented.

Bill> C) I can't arrange my desktop in any efficient way. Not being able to
Bill> put programs on the desktop or to arrange them freely in a window
Bill> makes launching programs a nightmare. This slows me
Bill> down.

TOS 2.05 already solves this one!

Bill> II) Hardware bitches

Bill> B) Our graphics modes suck. 640x400 mono is great for work. But everyone
Bill> else has at least 640x400 256 colors available now. The new TT
Bill> resolutions should be in _all_ of the machines by now. Come on Atari!

How true!

Bill> D) The power supply/keyboard/mouse all suck. ... The mice
Bill> don't feel very nice and are prone to quickly

Bill> wearing out. (Again Mega/TT seem to deal with this.)

Do you prefer Mac or Sun mice more? The Suns have at least optical
ones but they are large and clumsy. Whatever happend to the
beautiful small optical Xerox mice that came with their lisp
machines? I've heard that they are even compatible with the, shh,
Atari ST.

Bill> E) Non standard connectors. ACSI, monitor and drive ports, a male rs232
Bill> port?!?!?! Come on! If you are going to introduce new connectors, at
Bill> least give them advantages over the standard connectors.

Come on now! Things are becoming more and more standardized but still
many ANSI terminals come with either male or female RS232 connectors.
Likewise for any machine that's more than 3 years old.

Bill> By the way, if you decide to followup on this article, please don't include
Bill> the whole thing and respond line-by-line. Can you imagine anything more
Bill> agonizing than having to read this again in its entirety?

Hope I didn't cite too much to offend the net sensibilities.

}C compiler with the -O switch.
}
}On the TT rayshade was compiled with GCC 1.40 and mintlib16.

Don't you think you should have compiled both with GCC 1.40 to make things
a little closer? The Sun C compiler might (probably?) have better
general optimisation, and special optimisation for use on the Sun, while
GCC wouldn't.

}The code was run under MiNT 0.92.

You should probably also NOT run the test under MiNT, since it's not the
native TT operating system. You didn't run the Sun version under, say,
the Mach kernal, did you?

Converting a .img to a .gem is nontrivial, because .img - files are
raster graphics, whereas .gem - files are vector oriented (i.e. draw a
circle of a certain radius about a point, etc.). There is software on
the market which will do this job; it can get rather expensive, though.
I think the German software company TMS (they of TMS Data) sell one such
program; DTP programs should offer such a facility, as well.

Hope this helps

1315. Re: SM124 Monitor Problem

Newsgroup: comp.sys.atari.st
Date: 1992-02-07 15:50:25 UTC
From: knop@dutecag.et.tudelft.nl
Message-ID: <1992Feb07.155025.10087@donau.et.tudelft.nl>
Source record: 225916

Three persons {volker@sfb256.iam.uni-bonn.de (Volker A. Brandt),
ehobbs@nmt.edu (Eric Hobbs) and au036@cleveland.Freenet.Edu (Chris Burgess)
wrote about their problems with fading SM124 monitors when the screen
contains only a few white pixels.

This problem was solved in 1988. See the exerpts from an article by
Werner W. Braun, that I include below. I have succesfully applied this
fix (which costs 1 resistor - so it is cheap) twice and it completely
cured the problem.

:From
dutrun!mcvax!uunet!husc6!bloom-beacon!think!ames!pasteur!ucbvax!DDATHD21.BITNET!XBR3D815
Thu Aug 11 09:26:23 MET DST 1988
:... some lines deleted ...
:I decided to take an oscilloscope and did some measurements.
:As far as i know at two places the brightness of a CRT is controlled:
:
: 1) the first gate (hope this is the right technical term)
: 2) the cathode voltage/current.
:
:The voltage between cathode and 1st gate should be constant, by adjusting this
:you can control brightness of the monitor.
:
:Therefore i measured the voltage of the first gate against ground: it was
:constant, so this was apparently not the cause of the trouble.
:Then i measured the cathode voltage, which should be +70V as the schematics say.
:I found these voltage to be screen-image dependant:
: with a light screen i found +70V,
: with completely dark screen i found +85V.
:The cathode current varied between 0mA (no bright, no contrast) and 17mA (full
:bright and full contrast). So i think the problem is a bad regulation of
:cathode voltage. If the load is too small (dark screen or only some light
:characters on a dark screen, the cathode current is small) cathode voltage
:goes up and voltage difference between cathode and 2nd gate goes down --->
:screen fades.
:
:And now my fix:
:Beware --- I'm a simple minded chemist who ownes a soldering iron but is not an
:EE, so i will take no warranty for any side effects of my fix. It works with
:our monitor, but i fixed it today and so have no experience on the long run.
:It's a simple fix and should do no harm to your SM124. What do i do?
:I put a little extra load (1.5mA) at the high voltage transformer, so that the
:current never sinks under 1.5mA and cathode voltage never goes up again. With
:maximum brightness and contrast i measured 17mA, in normal operating condition
:about 8-13mA, so this extra current should never overload the transformer. But

:i give no warranty for this! Be carefull if you turn on full brightness and full
:contrast.
:
:The procedure is given for a monitor manufactured in oct '87, the newer ones
:have a different PCB layout.
:
:1. Open the monitor by removing the 5 screws.
:
:2. Look at the small board which is plugged on the end of the CRT. There you
: find the names of the parts printed. Look for C308 (47uF/100V) at the lower
: right edge of the board. If the board is covered with a shielding, you may
: have a newer monitor and this fix possibly does not apply.
:
:3. Get a resistor 47k ohms 0.25 W and solder it across the pins of C308.
: Put the resistor at the right boarder of the board so that it does not
: touch the monitor box later.
: Pay attention to the small space between the monitor box and the board.
: Possible Damage of your monitor!
:
:4. Close the monitor, cross fingers and switch on. Problem should have gone.
:
:PP: I also found some differences between the circuit drawings and the actual
: board, but this should be no problem. But i supplied R302 with 1k/0.25W,
: but this is not necessary for the fix
:
: part was should be
: ---------------------------------------
: R302 open 1k
: R311 68R 47R
: R312 270R 240R
: R313 820R 680R
:
:
:I hope this will help someone else, forgive the rather long posting.

>
> Not 'rm u:\proc*' or manual killing of background jobs.

Well, you've just ruled out the easiest solution :-).

Other possibilities (in order of simplicity):
(1) Don't leave MiNT. :-)
(2) Write a simple start-up program that runs your shell, and when that
exits does the equivalent of "rm u:\proc*" automatically.
(3) Get the MiNT source code. Look in the file "filesys.c" and the
function close_filesys(). Change the lines:
if ((f = curproc->handle[i]) != 0)
do_pclose(p, f);
to read:
if ((f = p->handle[i]) != 0)
do_pclose(p, f);
and recompile.

Or, you can wait until MiNT 0.93 comes out...

1319. Raytrace to Spectrum Converter

Newsgroup: comp.sys.atari.st
Date: 1992-02-07 16:34:01 UTC
From: Nick.Smith@tdkt.kksys.com
Message-ID: <697509796.0@tdkt.kksys.com>
Source record: 225934

There is now a GFA Raytrace to Spectrum 512 picture converter
availiable to finally get Raytrace pics into an editable/convertable
format. There is a Shareware demo file available on Compuserve and
GEnie (SUL2SPU.ARC) for a limited version that will let you view
converted pics with any Spectrum viewer/slideshow. The pics are
not fully compatible - you must send in your $5 shareware fee to
get the full version. (The demo will 'bleed' Spectrum's red menu
colors into your pics, annoying enuff to warrant sending in $5)

1320. Looking for Moniterm/Viking video card

Newsgroup: comp.sys.atari.st
Date: 1992-02-07 17:20:37 UTC
From: chuck@umbc5.umbc.edu
Message-ID: <1992Feb7.172037.20871@umbc3.umbc.edu>
Source record: 225910

I have a Moniterm Viking 1 monitor for my PC and would like to use it on my Mega 4. I know that there is a card available for this, but have been unable to track one down. I would like to avoid paying retail for it, so a used one would be very nice.

Also, if I am wrong in assuming that my monitor will work with this card, please do tell me!

Thanks!

>and memory upgrades implemented?
>
>Thanks,
> Doug Plate
> plate@cdsmn.mn.org
>

Not very easily. As far as memory upgrades go, anything below a MEGASTE/TT
your looking at quite a soldering job. And even if you don't have to solder
as with some memory upgrades, like Zubair's 3D 4 Meg upgrade, you have
reliability problems.

ST's are pretty limited in memory expansion. You have a max of 4megs, without
doing heavy mods to the machine. The processor speed sucks too. Nobody
operates at 8Mhz anymore. I have a MegaSTE, it runs at 16Mhz and I still
consider that very marginal, even for general purpose use in the 90's.

A God, er, I mean person called David Small is working on fixing speed,
expansion and memory size problems of the ST. The SST board, as it is called
will bring us back to the performance mainstream of computing again.

The only drawback, is that Mr. Small has been having lots of problems
manufacturing the SST, so it isn't expected to be truly available in any
significant quantities until summer 92'.

I would recommend going the SST route, and buying a MEGA STE. Your gonna end
up with a machine that has far more potential than Atari's TT ever will.

-Greg

Of course, there are other alternatives to the ST you know...

1323. Amiga, Atari ST, modems, monitor for sale

Newsgroup: comp.sys.atari.st
Date: 1992-02-07 17:49:20 UTC
From: clf3678@ultb.rit.edu
Message-ID: <1992Feb7.174920.1800@ultb.isc.rit.edu>
Source record: 225917
Cross-posted to: comp.sys.atari.st,misc.forsale,misc.forsale.computers,comp.sys.amiga.marketplace

The various items listed here are for sale. If you are interested in anything here, please contact me via:

GEnie: C.FREEMESSER
Internet: clf3678@ultb.rit.edu
clf3678@ritvax
Phone: (716)328-5505 after 6pm EST

Prices do not include shipping. Will make a deal on multiple purchase of items, but prices are pretty low. Everything listed here is in PERFECT working condition! I'll find out the EXACT UPS shipping charges for anything you want to order.

Amiga 500 computer system. About 4 months old. Includes the computer with a 1MB Supra memory expansion (total memory 1MB). This was one of those starter kits that came with the Amiga 520 RF/color composite adapter, TextCraft Plus, Tetris, and Where In the World is Carmen Sandiego. Complete with all manuals, disks, original packaging, cables, etc. I will throw in a copy of "Amiga for Beginners" by Abacus Books, a few European mags, and Gauntlet II. I'll also include the original reciept for everything so you can take advantage of the remaining warranty period.

$300

BMI monochrome monitor. A little old, but works just fine. Green phosphor display, no sound. Ideal for use on older computers like the Apple II series (which did not require sound). RCA jack for video input.

$25

Zenith Data Systems 2400 baud modem. Only used a few hours. This is a "standard" modem, with Hayes compatibility and a size that fits easily under a telephone. Has the standard 8 LEDs on the front, with power switch on back. Includes manual.

$65

Zoom 2400 baud external modem. Similar to the Zenith, except it has a smaller case and comes with original packaging. Power supply, manuals, etc. included.

$50

Amiga Software (all include boxes and manuals):

Alternate Reality: The City......$10
TransWrite (latest version)......$40
Wings.............................$30
Battle of Britain (LucasFilm)....$15
FirePower........................$10

Atari ST Software (all include boxes and manuals):

Great Battles (Napoleonic/Civil War).....$10
King of Chicago (Cinemaware).............$10
BattleHawks: 1942........................$15
Sub Battle Simulator.....................$10
Hole-In-One Mini Golf (2nd disk bad).....$2

From my earlier post, the Golden Image Amiga disk drive, Magnavox RGB 80
monitor, Joust (ST), and the Maxtor SCSI drive have been sold.

You could probably fix the picutre distortion buy adjusting the VERT LIN
turnpot inside of the monitor. As for the jitteryness, I don't know.
Be careful what you touch in there if you try this. Get youself a
plastic-shafted screwdriver (or monitor adjustment tool). I picked one up
for about $2 at a local electronics shop.

Doug Tarico Any opinions expressed are

>in the way of code changes.

Oh really? Most Unix stuff? Where you do you get your Unix code?
How about these (all common Unix coding samples):

```
pid = fork();
```

or redirect stdin:

```
close(0)
open(stdin_file, 0);
```

or simply open a file:

```
fd = open("X11.contrib.Z", 0);
```

or, my favorite (not really specific to Unix, but the lame PC arch):

```
cols = 1280;
rows = 960;
p = malloc(rows*cols);
```

etc. etc. etc.

How many code changes will be required to get the above to work with
your PC Borland C?

Don't tell me Borland, or any PC compiler, will compile "most Unix stuff".
Sorry, but I don't buy it. It's still MS-DOS and the ridiculous PC
architecture under there

In February, the Kitchener-Waterloo Eight Sixteen Thirty-two (KWEST)
Atari user group will have a general meeting with the spotlight on
the 16-bit library. We will also show Migraph OCR (Optical Character
Recognition) and Fun School 4 (educational software from the UK).

Our 16-bit library currently has over 400 disks of public domain
and shareware software.
In addition, there will be our updated catalog disk and our
disk-of-the-month.
Our 8-bit library is also available at this meeting.

As well as our own newsletter "The Hard Copy", we will also give
attendees the February issue of AtariUser.

The group welcomes new members and visitors with
8-bits, 16-bits, or those just curious.

Meetings held at the University of Waterloo in the
Math & Computer Building.

Room opens at 7:00 pm. Meeting starts at 7:30 pm.

Wednesday, Feb 12, 1992
DCS Course Room, Room 2009 (2nd floor)

Call 579-3695 for details.

Hope to see you there,
Dani Roloson

I modified the uw source to be compatible with gcc so that I could do just this. Unfortunately I am not going to have any time in the near future to actually do it. After looking at the source code, it didn't look as simple as I had hoped that it might be. I just settled for fixing up the cursor keys so that they work with emacs and tcsh.

There is a fortran compiler on atari.archive in the languages directory.
I think the filename is bcf.lzh. I tried it on a couple of simple
files and it seemed to work OK, although the error messages were in
German I believe. There is no front end (f77), but you can probably
whip up a little script to do the job.

|> accusing others of arrogance.
|>
|> ---
|> Steve Yelvington

How extraordinarily silly. Screwdrivers and socket wrenches are different tools, designed to accomplish diffent things, and they operate on different objects. Dump trucks and school buses are the same. One operates on dirt clods, the other on children, though some people would argue the difference.

Pagestream and Calamus are more like buying a Craftsman vs. a Stanley brand socket wrench: the grip, feel, and controls may differ, but they operate on the same objects and try to accomplish the same tasks. Pagestream and Calamus are each page layout programs. They operate on text and graphics and aim to produce a finished page. Thus, these are two different implementations of the same tool, which differ in their methods.

The original poster has a legitimate complaint that Calamus does not support an industry standard page description language, postscript. The writers of Calamus, of course, have no obligation to support such a standard, so Steve is correct in saying that a user who really _needs_ postscript will need to choose pagestream. This, however, is not a solution, but only a work-around for a person who wants Calamus _and_ postscript.

Calamus has done something innovative in creating their own, better page description language. It would do them, and atari users, well to see Calamus downgrade itself and write a postscript file.

Comparing the differences between Pagestream and Calamus to the differences between a school bus and a dumptruck is not wholly unlike comparing the human brain to a bowl of Jello, though, again, in some circumstances some people would argue the difference...

All gateways have _two_ or more internet numbers. That is why they are gateways. Perhaps cs.uni-sb.de is a gateway.

Well, that's ONE drawback. The other is that these things will be ridiculously expensive. I can't remember the exact price list I saw (it might have been in ZNet a few months back), but these add-ons make the ST about as expensive as the (nameless) machines they're designed to compete with.

The TT is more cost-effective, I believe. Expensive but easier to expand.

I stated this because:

The TT's 32Mhz 030is quite SLOW compared with the potential Dave Small's SST board, which can clock 40Mhz reliably, I have even heard he has tested the SST at 50Mhz with no problems.

Dave is also working on REAL expansion options for the board, like video and sound. Which will probably have a greater impact on the Mac side, when he gets 32bit color quick draw going...:).

A TT, a 32bit machine, has a 16Bit VME bus on it. What a disaster. Not only that, but the VME bus was purposely crippled NOT too allow cpu upgrades, memory upgrades etc.

Basically its only good for networking and MAYBE enhanced video boards.

If you can wait, your gonna be a winner either way. I am planning on waiting till summer until Dave gets his SST board out.

If he doesn't have it out by then, I am going to have to get SOME 32BIT machine option, and it AIN'T going to be a TT. More than likely, a IIci, Next pizza. I would LIKE to spend it on Dave, but I have waited to long, already and my coding skills have outgrown an 68000 at 16Mhz.

>ROOT DIRECTORY AS THE FIRST DISK! I am at a loss as how to recover
>the files, as only the directory has been wiped. The problem would
>also happen when I renamed existing disks!

I checked today my disks, and guess what, eight of them were in same
condition!!! Arggh!! I got 1040STe, so the problem must be in this new
STDCAT version... I bet the programmer of this (in other ways an
exellent program!) must be really happy to that he had that disclaimer
there! <sigh!> luckily the database is good, so I can check what
programs and files I have lost. 8-(

I hope there will be a bugfix, because before that I would not touch
this 5.0 version even with a long pole.

1346. upgrading

Newsgroup: comp.sys.atari.st
Date: 1992-02-08 10:51:14 UTC
From: sslee@micromed.net.netcom.com
Message-ID: <4ZNTFB2w164w@micromed.net.netcom.com>
Source record: 225943

I'm finally thinking of upgrading my TOS from 1.0 to 1.4.
However, I would like to be able to access 1.0 for certain
programs that require it. Is there an available disk (like
the one that was initially given when the STs were first
released) that contains TOS 1.0? Does this prevent me
from using programs that autoboot (a program in the
AUTO folder or a program booting from sector 0)?

From: ROBERT MARTIN Read: 15 times
[3 Replies]
To: All
Subject: Help

Doe`s anyone out there have an idea as to how I can use Pagestream to print
then switch to a program I wrote to print out reciets/invoices. I know that I have enough memory to run both these programs (mine only requires 60K). Multitasking would be the obvious solution but I can`t afford the software (but I suppose I could swap some software for it if I had to). What I am really looking for is something PD that lets 2/3 programs reside
in memory and lets the user swap between them via hotkey (my program "bobtill" is not Gem bassed).

pleeeeaaaassssseeeeee help

May I sugest MagaPaint or MagaPaint Pro, this is a mono drawing program
and it does have electronic circuit symbols, but you won't find this
program cheap.

It is sold in the USA by CodeHead Software..

I wouldn't recommend getting a Mega Ste and a SST since they are not
compatible. The SST is meant for a DIP based 68000 which the Mega Ste doesn't
have. Dave is planning on making a Mega Ste version of the SST, but then
again he's been planning on doing lots of other things as well. Your best
SST route would be to find a used Mega ST or 1040ST. The SST will work with
a 1040 or 520 but you'll have to put the motherboard in a bigger case.

I had the same choice a couple months back and I opted for the TT :)

Hello fellow Atari ST Users.

I wish to add a Hard Disk to my old and trusty 1040STF.
It would have to be at least 20 or 30 Megabytes.
My computer has TOS 1.0
What is the best deal around that you know of (new) ?

If anyone is willing to sell theirs, let me know.
What is a good source of mail order houses for the ST ?
(I think I'd like to upgrade my O.S. also...)

Thank you

Source record: 225856
Cross-posted to: comp.sys.atari.st,misc.forsale.computers

Atari 1040 ST, internal clock, 2.5 meg RAM easily upgradable to 4 meg.
This computer is in good condition. I may be willing to sell the RAM
upgrade separately if there is interest. It is a Z-RAM 3D solderless
upgrade and is populated with 2 meg of 70 ns RAM. It will work in any
520 or 1040 ST. Here is what I'd like to get :

1040 ST (and somewhat flakey internal clock) : $215
Z-RAM 3D upgrade with 2 meg RAM, software and docs : $150

Or how about a bargain !? Take both for : $315

Let me know if you are interested. Either send email to the address below
or call me at (602)795-7633. Thanks.

Doug Tarico Any opinions expressed are
dtarico@mis.arizona.edu just your imagination.

How about the Turbo 30 from Fast Technologies? It has capability to
handle up to 32Mb 32bit FastRAM, it has a 40MHz version and it has a
8MHz 68000 on board to ensure 100% compatibility to old software.
Only disadvantage is that it is a lot more expensive than the SST, but
still very powerful compared to the price and cheaper than a
_good_enough_ Mac or NeXT.
And, just to keep you out of troubles, why don't you choose Sun SPARC?
Much better value than any Mac or NeXT...

Just another one waiting for the SST....

1356. Supra 20 Meg HD for sale

Newsgroup: comp.sys.atari.st
Date: 1992-02-09 06:48:16 UTC
From: aa399@cleveland.Freenet.Edu
Message-ID: <1992Feb9.064816.20714@usenet.ins.cwru.edu>
Source record: 225853

I have a Supra 20 Meg Hard Drive for sale.

The host adaptor was placed in the machine 6 months ago and is
brand new. I still have the receipt.

I haven't used the hard drive much since then due to lack of time
(I've been away from it for several months).

I paid $150 for the host adaptor.

The only thing that is wrong is that the Miniscribe hard drive
sometimes works and sometimes does not. When it doesn't, it needs
to be jiggled and it works fine. This happens sometimes when the
hard drive is turned on. If you have it on all the time, there is
no problem.

The hard drive comes with everything, case, host adaptor, power supply,
hard drive mechinism, hard drive software, original box, instruction
manual, cables, and everything else.

The host adaptor does have an internal clock.

Since the mechinism is 20 meg, you may want to replace it anyways.
Mechinisms are cheap now.

What I am interested in selling is everything BESIDES the mechinism.

The mechinism is just a bonus.

I have also told by many people that the problem with the mechinism
is known and can be fixed.

I was asking $220 three weeks ago.

I'm asking $185 now. First reply gets it.

You can't use 4 meg SIMM's on your Atari, because they are only 8/9
bits wide, you Atari data buss is 16 bits wide...

Adam,
Simply get a NULL modem cable. Connect the two ends (one on the Atari one
on the Amiga.. careful an IBM may result) and run the apropriate comms
package on each end and you are all go. If you are going to do a bulk file
transfer may I suggest you use Z*MODEM for this purpose on the ST try using
XYZ2.ttp .

Cross-posted to: rec.games.misc,comp.sys.mac.games,comp.sys.ibm.pc.archives,comp.sys.ibm.pc.misc,comp.sys.atari.st,rec.games.programmer,rec.arts.int-fiction

[NOTE: This message is posted semi-regularly.]

The Unnkulian Unventure Series
Interactive Fiction for the 90's

Remember the good old days, when adventure games challenged you with great puzzles and evocative descriptions without resorting to using any graphics at all? We really miss Infocom's emphasis on gameplay rather than glitz, so we've decided to write our own adventure games along the lines of those Infocoms we liked so much.

If you're looking for top-quality interactive fiction comparable to Infocom's commercial offerings, check out the Unnkulian Unventure series of games, shareware text adventures available from an archive site near you!

In _Unnkulian Underworld: The Unknown Unventure_ you play the part of Kuulest's slave, and must recover the Orb of Studosity from the evil Unnkulians. Kuulest, the old geezebag, has died and left you with nothing to go on but a cryptic message about saving the planet. You'll encounter amazing Acme products, the infamous Guardian, those witty creatures known as Drolls, a giant beaver, and even the Unnkulian Warrior. <Gasp!>

In _Unnkulian Unventure II: The Secret of Acme_ your adventure continues as you try to create some good press for yourself -- wouldn't want to fade into anonymous obscurity, now would you? Along the way, you'll find the answers to these compelling questions, and more:

o What happened to the Unnkulians?
o Why are Acme products so bad?
o What is this cheez stuff, really?

Plus, you'll get to explore Dawg Rock, a Duhdhist Retreat, Acme's clandestine prototypes laboratory, and even pay a visit to Acme HQ.

The Unnkulian Unventure games have already gotten rave reviews from numerous Infocom addicts and other adventure game connoisseurs, so why not give them a try?

The games are available for FTP:

PC and compatibles:
----

msdos.archive.umich.edu:

msdos/games/textadv/unnkul12.arc
msdos/games/textadv/unnk2v20.zip

NOTE: Newly uploaded files reside in msdos/UPLOADS.
Look there first for the latest version.

Mac:
---

mac.archive.umich.edu:

mac/games/adventure/unnkulian1.03.sit.hqx
mac/games/adventure/unnkuliantwo2.0.sit.hqx

Atari ST:
----

atari.archive.umich.edu:

atari/games/tads/unnkul12.arc
atari/games/tads/unnk2v20.arc

(Sorry, there's no Amiga or Unix version at the moment...)

Both games are shareware ($10 registration fee for each) -- registering
gets you maps and hints sheets from the authors. Support us and you'll
continue to see fun text adventures like these that fill the void left
by Infocom's disappearance.

Questions and comments are welcome!

Dave Baggett

I just ftp'd the "herm100b" file from terminator ... it looks really good, except I'm a little unsure on a few things. Can anyone help me out here?

First off, are the man files available in English? (I always did want to learn German ... but ...) Second, how well does this go with MiNT? What I'd like to do is have it run under MiNT and set myself up as a UUCP site.

Like I said it looks fairly good ... BTW, anyone know how much DM60 is in dollars these days? :-)

In <697293583.11664@minster.york.ac.uk>, mjl-b@minster.york.ac.uk writes:
In article <6498@uqcspe.cs.uq.oz.au> warwick@cs.uq.oz.au writes:
[...]
But this only gives 90 dpi .IMG files. Does anyone have a tool that will
take a .GEM file and produce an .IMG file of any dpi? (I'm particularly
interested in 300dpi equivalents, as that would match my printer's
resolution.)

GemView from fiebelko@petra.informatik.uni-dortmund.de (Dieter Fiebelkorn)
will import .GEM and save .IMG. Gemview works as an ACC, GTP and APP. You
can scale the .GEM-file by typing the scale-factor.

Gemview is Shareware and the actual version is 1.1.

Correct me, if I'm wrong ... HANK

1370. Problems with Spectre GCR 3.0

Newsgroup: comp.sys.atari.st
Date: 1992-02-10 10:23:38 UTC
From: sprache@ztivax.UUCP
Message-ID: <9692@ztivax.UUCP>
Source record: 225866

There seem to be differences between the manuals and the reality
in Spectre 3.0:

1. Aladin disk support:
I can't move any files from Aladin disks to Spectre or Mac disks.
Is there a trick or is this really a missing but promised feature?

2. number of hard disk partitions:
Manual: 16 hard disk partitions are supported.
Reality: I can see only 8 partitions. There is still no way to see
the upper 4 partitions of each disk drive.

It seems that I got the wrong software version from Gadgets.
Is there anybody where the mentioned features work?

Thanks for any help.

This is partially true. There is quite a big BUT, however. GCC on the 680x0 processors produces almost the best optimised code for the processor, likewise the Sun C compiler on the Sun. Also, GCC 1.40 doesn't fully support the SPARC processor (it can't handle some of the addressing modes).

>
>}The code was run under MiNT 0.92.

Unfortunatly, rayshade needs a multi-tasking with pipes to preprocess its data files. (And anyway, MiNT produces at worst a 10% degredation in performance, so it wouldn't have made too much difference)

>that, but the VME bus was purposely crippled NOT too allow cpu upgrades,
>memory upgrades etc.

Excuse me! The TT's VME is not CRIPPLED, it just doesn't (currently) support BUS-masters. Anyway.. who would WANT to put another CPU on the BUS unless you were doing something on the VME BUS which you don't want the TT tied up in doing.

Why "only" a 16bit VME bus? Well.. you'd need a MUCH larger case to support the 32bit VMEBUS... a double-eurocard is a large beast.. about 2/3rds the width of the TT as it is currently.

And who ould want to put memory on the VME BUS? VME BUS memory is only really good if you are using it as a buffer to pass data between two CPUs on the BUS. VME BUS memory is too slow to be used as normal RAM (even 32bit VME), it's best accessed via DMA transfers.

(By the way.. I've developed stuff for the VME bus, using a Sun SPARCengine 1e, a motorola 68030 card and an Analogic ADC/Multiplexer)

>

That is your perogative... but I wouldn't touch a Mac II if you want speed, from what I've heard it's slower than a TT.

Erm.. your coding skills won't have much more space to grow in with a 68030!

I have the following software for sale. All is in original box and has
docs unless otherwise noted.

Micro League Wrestling (WWF) $10.
Micro League Baseball II (with GM disk)$12
Degas (no box or dox) $5
Gunship (missing keyboard template) $10
Swiftar $5
Witness (Infocom) $7

Send E-mail if interested in 1/all

From: meulenbr@ce.philips.nl
Message-ID: <1992Feb10.140527.20399@philce.ce.philips.nl>
Source record: 225876

Hi,

I've been playing around with the version of mint posted a few months
ago, and I'm left with a few questions:
- I could not read minix filesystems. As soon as I do an ls of a
minix partition the system would start reading from the disk and
not stop any more. This also happens with the official disks of the
minix 1.5 distribution. Any suggestions how to solve this
- I use gulam as shell under mint. Unfortunately the version of gulam
that I have does not work nicely in TT med. res.
Is there a newer version?

Thanks,

1380. MicrOStyle/Microprose vs. Atari STe

Newsgroup: comp.sys.atari.st
Date: 1992-02-10 14:19:20 UTC
From: dmk@air31.larc.nasa.gov
Message-ID: <1992Feb10.141920.29967@news.larc.nasa.gov>
Source record: 225873

Hi netters,
My primary use for my Atari ST is word processing and personal
finanical management, but after the letters are written and the
numbers crunched, I like to kick back and _play_.
One of my regular favorites used to be Stunt Car Racer written
by Geoff Crammond and produced by MicroSyle/Microprose Software.
I say _used_to_be_ because recently I upgraded from a 1 meg ST to
a 4 meg STe (PageStream 2.01 never ran so great), and SCR won't
boot up.
Now this isn't really a big problem because I kept my old machine
(version 1.4 TOS) which still runs SCR fine, but I was looking
forward to trying out the datalink option between the two machines,
and trying some human competition for a change.
Now for the questions:

1) Can anyone verify this problem?
2) Does anyone know of a version of this game that works with the STe?
3) If you know of a version that works, where can I buy it?
4) Is there an upgrade path for the old version I have?
5) Failing the above, does anyone know of a hack for this problem?

Thanks for reading this, and double thanks if you respond!
Daniel Koppen

>whip up a little script to do the job.

The version of BC-Fortran I have (which seems to be the most recent
one around) produces incorrect results on complex exponentiations
(complex as in complex numbers, not as in complicated). Other than
that, it works OK. There is a translation list for the error messages
in the documentation.
It's straight Fortran77, thus no GEM calls or anything like that.

> Ralph P. Sobek Disclaimer: The above ruminations are my own.

I tried something like this on a couple of unlabelled disks. I can
confirm that indeed STDCAT50b does not seem to write the extenders on disk
volume names. However, I didn't have any trouble with garbled disk
directories or file structures. I did get the impression that, despite the
fact that STDCAT50b no longer uses disk serial numbers for cataloging
purposes, it _does_ seem to make use of serial numbers internally; I'm not
certain of this, however.
Ralph: two questions - (i) does your disk formatter write (random) serial
numbers, and (ii) did you by any chance have disk caching operating on

drive A: ?
Unfortunately, I don't know what to suggest as far as recovering your
files is concerned.

1389. Why Amiga folks come here so much

Newsgroup: comp.sys.atari.st
Date: 1992-02-10 19:07:58 UTC
From: mc4c+@andrew.cmu.edu
Message-ID: <wdZgqCm00UhWM4bQcZ@andrew.cmu.edu>
Source record: 225887

Just thought you folks would be interested in knowing:
I just spent some time over on the amiga boards (not posting flames, I have, and like the machine). The basic thead over on the c.s.am.advoc. board is this.
The Amiga is dead, or will be so in about a year or two (personally, I disagree with this assesment). In fact, they hate C= and its leadership even more than some of us hate the Tramiels. And even here, Atari is often defended. Over there, I almost never hear someone defending either their company, or their management, and only rarely defending the machine. Here, whatever amiga fire starters want to think about the ST, at least we have a bit more hope. Even doomsayers like me, Greg Carter, and Bob_R_ still think there is a chance.
Perhaps this can lend a bit of insight into the reason that the amiga folk often post over here. They read comp.sys.amiga.advocacy, get real pissed off, flame over there, get laughed at by the amiga people they think they represent, and so come over to c.s.a.st, and read all the positive, or a least hopefull posts, get jealous (not of the machine, but of the users cheerfulness) and so get out the lighter fluid and flame on. Perhaps they are mearly trying to bring some of the sour humour from c.s.a.a. over here. I can not feel angry at them, just sorry for them. So just ignore them, and give your condolences. And for god's sake, don't send them over to c.s.a.a.. That's what got them riled up in the first place!

JMHO,
mark

Yes, they do.

The Deskjet 500 driver is probably the best-debugged and most-used driver in
the CS-TeX package since Christoph bought a Deskjet 500 late last year.

Moral: If you want a classy laser driver, send CS a laser printer :-)

I still use WordWriter 2.0... It's 1988 or something I think... If I need pictures or a real font, I dump it into PageStream or TimeWorks. The time it takes to DTP the article/story/whatever is nothing compared to the time I'd be wasting if I had a souped-up graphical word processor with graphics and fonts...

Tempus would be even faster, but it doesn't have an online Thesaurus... ;-)

Well... actually, not really. Hey.. speaking of ads, did anyone ever see
that Lynx ad with the kid at school who goes to the bathroom to play his
Lynx? Or the one with the four kids at the busstop or somewhere playing
Gauntlet, and they say something like "up to 4 people can play.." then
you see three of them as steaming skeletons, and they look over at the
4th, and then you here "but only >1< can survive!" or something. It was
pretty cool! I LOVE the Lynx, but for some reason I'd never get one..
(call it $? call it what you will!)... same with the Amiga.. For some
reason I'm sick of them!? (just call me DEVOTED!) Bill

1393. Help: Spice circuit program

Newsgroup: comp.sys.atari.st
Date: 1992-02-10 22:05:52 UTC
From: dinsmm@aix02.ecs.rpi.edu
Message-ID: <48fswha@rpi.edu>
Source record: 225890

Greetings.
I would like to use the Spice program that I found in
atari.archive.umich.edu. However, it doesn't come with
any textfile that describes how to use it. I already have
a book on how to write the files that Spice uses, but
I don't know how the program wants it - there is a TTP
and a TOS file after unpacking it. Which one do I use?
Any help would be greatly appreciated.
Thank you.

I'd like some information on Neocept's WordUp word processor, if anyone
out there has used it recently.

Specifically:

1. Does it have a spell-checker?

2. Does it do lots of fonts and font features like italics and stuff WYSIWYG?

3. Does it support HP Deskjets and compatibles?

4. If it does support HP's, does the output look nice (i.e. near Mac
laser quality)?

5. What is the address of Neocept, so I can check as to what the latest
version is and get more info.

6. Where can I buy the most recent version?

Stick to TOS 1.4 its far better, there is no nead at all to go back to TOS 1.0..

The TOS 1.0 disk version loads in the low part of RAM, will be no good with games, at all that load in a fixed position, and most of them do..

I have a complete system here for sale at a great reduction!

1 Mega2 upgraded to 4 megs (TOS 1.4 ROM), 720 3 1/2 drive

SM124 monitor

ICD AD SCSI host adapter
-external case (under monitor style)
- 44 Meg 3 1/2" drive (miniscribe)
- SYQUEST 44 MEG REMOVABLE DRIVE (2 Cartridges)
= 132 Dard Drive Space!!!!!

Books -Abacus vol 2,3,4,5,6,11,12
-Concise atari st 6800 programming manual
- various GFA books

Replay 4 sound digitizer

IMG Scan (turns printer into a digitizer}

Hisoft Basic
Hyperfont
g+Plus
Multidesk
Hotwire
BattleZone
Omnirez
Falcon
IOnterlink
Dungeon Master
QuickST 3.0

Monitor Master

Word Up 3.01

Golden Image Mouse (very nice)

THE WHOLE THING FOR $1000

Please Leave E-mail or call me at (201)762-3587

First Offer gets the whole thing

Also PCSpeed for $100

1406. CrackArt drawing program

Newsgroup: comp.sys.atari.st
Date: 1992-02-11 08:31:04 UTC
From: doucet@ripolin.laas.fr
Message-ID: <6907@laas.laas.fr>
Source record: 225822

Hello, happy Netusers,

last Friday, I've dl'ed "crackart.lzh" from a.a.u.e. and immediately
tried it on my 1040STE (1Meg, 1DD, no HD, TOS 1.62). Worked fine...
Incredible drawing program...

(Incidentally, it does run on 1/2Meg 520 STE: not enough memory...
My son was sad for at least half an hour, but had his revenge with the
Mutant Camels...). Does not run neither in other rez than low one...

There's an impressive doc file (120 kB) I've printed via a SPARC2:
I've got a 44 pages document, all written in German...
Although France and Germany are neighbours, I can't speak a word of
German, just recognize from place to place words like Maus (mouse),
Doupplexxxxx (double click), but that's nearly all I could do.

By using and trying it, one can find how to operate this program (or at
least, some of its features (they are numerous)):
I've found some things I've carefully written down, trying thus to make
some sort of User Guide.

What I wanted to say: I'm far from having found all the commands,
(especially block commands such as perspectives, bulge and ring) and
would be happy if someone having used CrackArt would exchange informations
and ideas, so I could put them in my list, and eventually post it when
it is long enough to cover a good number of commands.

(A far better thing would be the authors writing an English (or even a
French ?) doc...: one cannot even find how much is the shareware fee...

You can reply by e-mail at the address listed below, or by the net.
Waiting to hear from you...

Jean-Etienne DOUCET
LAAS-CNRS, Toulouse, FRANCE.

1407. VMEbus enters the fast lane

Newsgroup: comp.sys.atari.st
Date: 1992-02-11 08:55:56 UTC
From: jww@uhunix.uhcc.Hawaii.Edu
Message-ID: <1992Feb11.085556.29680@news.Hawaii.Edu>
Source record: 225806

The current VMEbus (and VME64) specs allow data transfers at 10 MT/s (mega-transfer/sec) so a 4 byte transfer xlates into a bus bandwidth of 40 MB/s (80 MB/s for a VME64 8-byte xfer). While this is adequate for most people, the incessant quest for _more_ speed has prompted PEP Modular Computers (Carnegie, PA) to design a VMEbus-compatible modification, projected to cost about $100, which will accelerate data transfers to 200 MB/s!

From an Electronic Design article (10/24/91):

"Joseph Kreidl, PEP's president, and one of the key architects behind Autobahn, says that he's been working out details over the last few years, but the IC technology wasn't available until recently. Autobahn I, slated for arrival in early 1992, will transfer data across the bus at 200 MB/s. By the end of next year, Autobahn II should arrive, completing the push to 400 MB/s."

"...Autobahn reduces data-transfer latency on the bus to nearly zero. This feature will be a big boost to such applications as graphics, image processing, and mass storage. The same technology can also be applied to transparent cache transfers in multiprocessing schemes and fast data updates for redundant systems. Because the basic transfer mechanism is serial, any bus width can be defined. Hence, it lends itself to nearly instantaneous bus-width conversions. Autobahn can also serve as a high-speed bridge between two generations of buses, such as VME and Futurebus+."

Although Futurebus+ enhances and improves on many features of the VMEbus (such as 3200 MB/s bus bandwidth, low-noise bus logic), there is tremendous inertia behind the VMEbus; the Autobahn I and II developments should help to prolong its global acceptance. That is, at least until Atari adopts the Futurebus+ standard. :-)

|> what would happen if I plugged in say 4mb SIMMs into my STe? Would
|> I be able to access that extra memory?

As far as I know they are 'picompatible' but your STe will still give you 4MB
because he only uses the pins for 1MB SIMMs

|>
|> Im sure that for some reason its built to limit to 4mb (Atari foresight)
|> but theres gotta be a way? Considering that the 68000 is capapble
|> of addressing somewhere in the range of 4gb? (sorry if that number
|> is wrong, but I dont have specs with me)

68000 has 24 adress-bits 2^24=16MB
68030 has 32 " " 2^32= 4GB

|>
|> I dont mind taking a soldering iron to my machine, if thats what is
|> needed (In Ataris mind, my warrentee was voided about three days
|> after I received shipment, to install the 4mb.

Nobody has tried to maka an memory expansion for the 520/1040STe (yet).

Solution: 1. get a used MegaST
2. get a new MegaSTE
there are expansions for both that give your ST
12MB RAM (an ad states 16MB but at least the upper
2MB are reserved for hardware, ROM ...)
3. get a TT
with this machine you can expand to 32MB (with one board,
expandable with SIMMs) and you get even the power of the
68030/68882 at 32MHz [I know about the bus speed !!!]

The best:
Wait until the CeBit (11. to 18. March in Hannover,Germany) to decide
if the new price for the TT or something like the 'FALCON' is better.

PREVIOUS ANSWER TO THIS TOPIC

Roger.Sheppard@actrix.gen.nz writes .....

|> You can't use 4 meg SIMM's on your Atari, because they are only 8/9
|> bits wide, you Atari data buss is 16 bits wide...

OH, OH is that all you know about STs ?????????????

The ST uses TWO banks of 16 chips each. (the 16bits you said)
The STEs use TWO banks of TWO SIMMs each (2*8 (or 8 used of 9) = 16)

ONLY TO STOP CONFUSION.

1410. Motorola CD-I chips

Newsgroup: comp.sys.atari.st
Date: 1992-02-11 09:21:09 UTC
From: jww@uhunix.uhcc.Hawaii.Edu
Message-ID: <1992Feb11.092109.2948@news.Hawaii.Edu>
Source record: 225808
Cross-posted to: comp.sys.atari.st,comp.multimedia

Atari announced their support of the CD-I standard and this press release from Motorola contains interesting info about the next generation of CD-I components which may be designed in some of the systems Atari plans to introduce in '92. The combination of the Motorola 68340 processor, 56001 DSP, 44466 Video Decoder (mixing output from the MPEG and Atari custom graphic processors) and orchestrated by Multi-TOS and Microware's CD-RTOS, would add up to a machine that delivers thunder and lightning for a price that promises to be a drop in the bucket.

Motorola Semiconductor Products Sector has announced today (4/91) the availability of the first key part in the Motorola CD-I chip set, the MC44466 Video Signal Decoder. Motorola announced their co-operation with Philips Interactive Media Systems on the chip set in November 1989. Results of this on-going cooperation have been included in the CD-I demonstration system that Philips presented at Horizons '91, a major Motorola event organized for the worldwide press in Austin. Another key device presently under joint design is the MPEG-FMV, a full motion video decompression processor for CD-I applications.

The Video Signal Decoder, the MC44466, is a real time two channel video data decoder which can combine four image planes, by overlaying and mixing, into one final image. It can perform special effects like dissolves, mosaics, partial updates, etc. It is fully qualified in accordance with the CD-I "Green Book" standard and is now available to the worldwide market. The MC44466 will be followed by other key devices for CD-I systems:

o The MPEG-FMV decoder performs the decompression and display of full screen, full motion video conforming to the MPEG standard. It is a highly integrated, cost effective solution implemented in Motorola's High Density sub-micron CMOS technology.

o The MPEG audio decoder performs the audio decompression according to the standard defined by MPEG level 2. This device is based upon Motorola's DSP56001 24-bit digital signal processor.

o The MC68340, a 32-bit microprocessor, acts as the central processing unit to control the system modules and provides high speed data transfer. Previously released, this device is now being qualified for use in CD-I systems.

o The MC44200 is a triple 8-bit digital to analog data converter optimized for use in CD-I systems. It interfaces direct to the MC44466 and provides analog RGB outputs.

All these devices will be qualified to the "Green Book" standard and Motorola will be offering the complete chip set as part of their global semiconductor offering.

By providing a global source of qualified devices to all CD-I equipment manufacturers, Motorola aims to accelerate the acceptance of CD-I as a Multimedia standard and add momentum to its rate of growth as the next major consumer product innovation.

*CD-I "Green Book" standard - This standard is defined by Philips and Sony. It has two charters: To explicitly define the CD-I Media Specification and to assure that all CD-I and CD-Audio discs can play on all CD-I players in real time.

*MPEG - The Motion Picture Experts Group, is a joint ISO/CCITT standards committee, chartered with the task of defining a global standard for video compression.

1411. Re: Postscript on Atari's in general

Newsgroup: comp.sys.atari.st
Date: 1992-02-11 10:56:54 UTC
From: s_grunwa@irau30.ira.uka.de
Message-ID: <kpfavmINNl4b@iraul1.ira.uka.de>
Source record: 225811

> What I objected to was the "Calamus is so great I don't see why
> you should even consider using anything else" argument. I stated why we
> might want to have Postscript output.

I have heard of a lot of people wanting postscript output, but
i don't see what are the benefits of it. YOu need a lot more
processing power than the ST has in the printer, were you can't
use the power fore anything but printing. This is not economic and
therefore mostly used by universities throwing away the money of
the tax payers.
Any laserprinter i have seen so far has an interface for bitmap
grafics, which can be used easily by calamus. The price for
postscript is, here in germany, not a few bucks, but doubleing
the price for most printers. You don't get a reasonable (fast enough)
postscript printer for below 5500.- DM and a HP Laserjet III is
sold for 3000.- and consumer lasers from sharp and others are below
1800.-. even if i missed a postscript laser, I don't think there
is one below 3000.-, which is in an extended range of a few bucks.

If you have seen the speed the Atari DMA Laser prints (and MAC's use
SCSI Lasers too now), you know why no postscript does not touch
serious Calamus users.

Buying a bigger computer for the layout and using the power of
this computer for layout is just the better way of DTP. Only
bookprinters (600-2500 dpi) are affected by this, but using a
TT as a preprocessor is very common here in germany, since you
have a better userinterface too.

Regarding the facts, i don't see how to make profit out of a
postscript module.

Knut Grunwald

P.S. If you disassemble the printer definitions, you will find
an easy way to get a postscript printer to work. You can't edit
the output, but that should not matter.

1412. Re: More RAM!

Atari decided to check addresses with a MMU. This is the
problem, if you want to upgrade beyond 4 MB.

The Mega STE has a different MMU, which allows the upgrade to the
maximum of 15.2 MB (16-IO-ROM). A company called GengTec in
Duesseldorf is selling a memory expansion card, which cheats the MMU
and allows the same amount of memory.

The upgrade is not easy and one should think about the relative
benefits of an upgrade of the 520 ST or selling the machine and
upgrading a Mega STE 4 (~1200 DM for 12 MB resulting in 16 MB)
or buying a TT. The TT is very good equiped and should be at least
4 times as fast as the normal ST (4 = double bussize and double
busspeed does not take into acount: optimized processor for
integer and floating point operations (factor 2 - 10 (more for
trigonometric operations as sin, cos)) and the cache, which optimizes
loops). The decision is not easy, but if you think of your ST
as an old car, which needs repairs or replacement, you now the
type of decision.

Knut Grunwald

> Does it go all the way up to 6th level?

The highest level I've gotten to is:

Fighter - Master 5
Ninja - Master 5
Priest - Master 6
Wizard - Master 6

Boy did it take me a long time to get to this point. I'm just
going to get all the attributes to Master 6, and then play
Chaos Strikes Back, and never play DM again.

FYI: Once you get your characters to this point, their health and
stamina points are 999, mana is about 350, and one fireball has
the distructive power of +700 health points. Getting new mana is
very fast! Look out Chaos, I'm out to get you!

Question: Is there really a master 7? or is it just that when your
characters make it to master 6 for all your wisdom, your promoted
to master 7 automatically?

There are houndreds of cards available for the TT. It is of course
possibly to add memory to the VME bus, but it is smarter to buy
a TT ram card instead. A 16 bit VME bus is just fine, but I wish
there were more slots.

Your basing your views on a specific group of messages. I invite anybody who believes that to read comp.sys.amiga.advocacy. To say that nobody is defending the computer or Commodore is laughable. Also, comp.sys.amiga.-advocacy is just for such types of conversation, thus it is filled with it. Does that make sense? For a more balanced view I would suggest you also check the various other Amiga news groups, and while you are at it you might note that message traffic in even specific areas (like graphics) is much larger than the entire Atari area combined. I've seen the flow in the Atari area drop little by little over the past two years. Does this mean something? Well, judge for yourself...

Here in the United States (and let me clarify, just for the record, that this is one BIG country), there is one (1, as in less than 2 and greater than 0, not 10, not 100, but just plain old "1") printing company that uses the Atari as the front end (with Calamus). Apparently they only got into this because some Atari magazine companies wanted to use Calamus. At any rate, it is in California. Here in the U.S. you can find many (probably over 100 in Columbus alone) printers who can output all types of resolutions (usually 1270 dpi) from Postscript files! Note, 100 in Columbus alone, compared to 1 (one) in the whole damn country! This is the one single factor in many possible purchasers of Calamus which moves them over to PageStream. I would say I know of at least four sales of Calamus which have been lost because of this. I am personally waiting to even CONSIDER upgrading to Calamus SL until it has Postscript compatibility. If it never gets it, I never order the program, period, because I can use it for what I want. Sure, Calamus PDL is better than Postscript, but when I'm limited to 300 dpi (HP III) output, I can't even get output as good as 1270 dpi postscript, let alone any of the higher resolutions. Also, with the advent of Postscript level 2, postscript is just as good as Calamus PDL, and includes "hinting" which the brains of ISD decided to leave out (why?).

And THAT, my good friends is why we want postscript!

By the way, you really should read my cool .sig file ;-)

Whats the story on this monitor. I've seen it mentioned here on the net and have recently seen ads for it in the UK mags. Is is available in the states? A 14" Mono screen sounds tempting.

Bob Malay

1421. More MicroPlay/Microprose vs. Atari STe

Newsgroup: comp.sys.atari.st
Date: 1992-02-11 16:02:20 UTC
From: dmk@air31.larc.nasa.gov
Message-ID: <1992Feb11.160220.10500@news.larc.nasa.gov>
Source record: 225816

Hi again netters,
I just won't go away. This is the last post, I promise (X).
Crossed Fingers ^

A couple of days ago I lamented that after I bought my Atari STe,
my copy of Stunt Car Racer from MicroPlay/Microprose would not work.
Most of the replies said I was S.O.L., but one kind soul said that
SCR was re-released as a budget title in the U.K. and this version
was STe compatable. I quickly called the only import dealer I know
in the U.S. (Sideline) and they said they don't have it. (They also
didn't seem _real_ excited to be shipping Atari orders.) However, I
looked over some of my other catalogs and came across a software
title, 'Stunt Track Racer' (Joppa Computer Products).
Is STR the same as SCR? Does Stunt Track Racer run on a STe?
Is there a light at the end of the tunnel?

Hopeful again???
Daniel Koppen
dmk@air31.larc.nasa.gov

P.S. Thanks to again to all those who responded to my first post!
And thanks to _YOU_ for reading this!!!

>by Geoff Crammond and produced by MicroSyle/Microprose Software.
>I say _used_to_be_ because recently I upgraded from a 1 meg ST to
>a 4 meg STe (PageStream 2.01 never ran so great), and SCR won't
>boot up.

If the only problem is the upgrade (SIMMs I suppose), you should try to
find a program called mem_xxx.prg, which can simulate 1mb or less on
your computer. I am not sure, but I think it is included in the
Turboass archive together with source on atari.archive ...

Marinos Yannikos

PS.: Of course, you can always remove the SIMMs temporarily! :)

1423. GIF viewer

Newsgroup: comp.sys.atari.st

Hello netters and fellow Atarians.

Could some kind soul who has ftp'd a GIF viewer please E-Mail me a copy?
The reason I ask is that I have had problems with ftp here, and I have a load
of Satellite images in GIF format I want to access.

Many thanks in advance. I know its not the done thing to ask such things
in general, but as the viewer is such a small piece of software it seems a
bit over the top to pester our admin people over it.

Thanks a lot.

You are right here. IMG files are essentially bitmap files. Once an IMG file is loaded into EasyDraw it treats the bitmap as a single entity. This means the bitmap can be rescaled, rotated etc. within the drawing. However, EasyDraw always stores and prints it as a bitmap without being able to take full advantage of the print capability of the printer.

There are repackaged TT machines available from third-party vendors
(in Germany, at least) with muliple VME slots.

The Atari ASV group also wishes there were more slots. It would be
really nice to be able to put an Ethernet _and_ a color graphics
card in the same TT.

Hello netters,

I have a related question too. You see I've written this ATZENTA program which is running fine under TOS 1.00 and TOS 1.02. Now one of the users whose ST has TOS 1.04 in ROM, reported that using gulam and passing arguments to ATZENTA does not work at all (i.e. the command line gets corrupted). My beta tester who also has TOS 1.04 tried to pass agruments via NeoDesk III (dragging the arguments over ATZENTA's icon) without sucess (i.e., corrupted command line).

On the other hand, on my system (TOS 1.02) I have tested it with Gulam, Mupfel, ksh, and Gemini (dragging the icons....) and everything works fine. This makes me suspect that MWC 's way of parsing the command line (i.e., argv mechanism) is incompatible with TOS 1.04 (or vice versa).

Is this correct? If yes, is there any patch for it? Actually, I 've ordered TOS 2.07 and it'll be here in a week so I can test myself... but even though I don't know how to fix the problem...

thanks in advance...

The Trenton Computer Festival 1992 will be held at Mercer College on
April 11 and 12. Files with all kinds of good information are available
for anonymous ftp from pilot.njin.net (128.6.7.38) in pub/TCF/tcf.
They include:

what.is.TCF - history and description of TCF
spkr.form - if you want to be a speaker
gen.info - general info about TCF, directions, parking, etc.
vendors - if you want to rent a booth or a flea market spot
speakers.Z - preliminary speaker line-up

1992 TRENTON COMPUTER FESTIVAL

TCF needs lots of volunteers to be a success. This year, volunteers are eligible for special prizes in their own drawing!

By volunteering four hours of your time, you will also receive a free two-day ticket to this year's annual Trenton Computer Festival, April 11-12, at MCCC, a colorful cap and a free lunch ticket.

Volunteers work in several areas, as needed by the organizers. Some of these are (1) helping Security to direct traffic, (2) helping speakers and people attending talks, (3) providing general information to attendees, (4) selling tickets, (5) helping in the flea market area, (6) helping in the vendor areas, (7) checking for tickets at the doors, and so on.

Thank you for volunteering. Have fun!!

I. Personal information:

NAME:_____

HOME (Evening) TELEPHONE:_____

WORK (Day) TELEPHONE:_____

II. Please make three choices from the list below:

SAT:6-10 SAT:10-2 SAT:2-6 SUN:8-12 SUN:12-4

First choice:

Second choice:

Third choice:

Return the completed form as soon as possible but no later that April 1, 1992. You will receive a telephone call from the coordinator of volunteers telling you when to report. Go directly to the lobby of the Theater Building on the MCCC campus to get your tickets, cap, etc. and your assignment.

Thanks a lot for helping!

Pete Holsberg
Steering Committee

I've spoken with people who have ordered software directly from England.
They said that the English dealers will "bend over backwards" to please
us. Just call or write one of the advertisers out of one of the numerous
English ST magazines (include your credit card number if you write), and
they'll take care of you.

>file in landscape mode. Has this been implement in an drivers on the ST (Do the
>drivers in CS-TeX allow this for example)

I can't pass up the opportunity to advertise a little. The above can
be done with dvips and ghostscript, with the aid of a little file
called twoup.ps. Dvips and ghostscript are available on atari.archive,
and twoup.ps is widely available.

dvips -h twoup.ps -t landscape file.dvi

produces a postscript file with two pages of text printed in landscape
on a single page.

Then you can use ghostscript to print it.

>and ideas, so I could put them in my list, and eventually post it when
>it is long enough to cover a good number of commands.
>
Mail bounced a billyon times, thus I post.

Blocks in Crackart are used exactly the same way as in the old
DEGAS package format; hit ESC, move the crosshairs and hold down the
leftmousebutton to define your block. Once defined, it is saved
in a buffer that will work with ring, bulge, and all the other nifto
commands. You can then go back to the original picture and put the
modified block wherever. Remember to use the numberpad keys to select
different window copies, and that esc will loose you your current block unless
saved.

Now here's a question for you. Have you figured out how to call up
the color-palette yet? I've tried every button in the book and can't
find it.

Is all.

>
> Like I said it looks fairly good ... BTW, anyone know how much DM60 is in
> dollars these days? :-)

English docs: don't know, maybe you should contact Martin P. Ibert,
the one who wrote Hermes.

MiNT: uucico was written in GFA Basic and does not work with Mint. All
other programs do, I for instance send mail&news by running mmail.ttp
in the background. I use mmail 0.991 for this, version 1.0 won't work
this way (messes up the screen even though redirected to /dev/null).
Principally it is possible to set up a Hermes uucp site that can be
polled. I hope a uucico written in C will show up soon...

DM 60: 1 US$ is about 2 DM (more or less), so 60 DM should be around 30 US$.

From: warwick@cs.uq.oz.au
Message-ID: <6586@uqcspe.cs.uq.oz.au>
Source record: 225837

A friend of mine has a TT. At first, I thought it was a bit of a lemon, because quite a lot of stuff (many games) didn't work on it.

But for programming, it is FANTASTIC - sooooo much speed. We have done some amazing Fractals - the 68882 really makes a difference (factor of 10 or more over TT speeds without it - that's at least 40x ST!).

The best set-up we've found is MiNT and MW2. Although MW2 needs LOTS of work done on it (But it is a great start). You can compile in one window, edit in another, have your favourite DAs up too (although MW2 HOGS the CPU for its subprocesses, because otherwise GEM would just WASTE it).

I got a copy of FSMGDOS last month from Goldleaf. It cost US$35 as an upgrade
to WordFlair II. It's _wonderful_! One hell of an improvement over the old
GDOS :-).

From: aking@BBN.COM
Message-ID: <kpgrr1INN1gs@news.bbn.com>
Source record: 225841

As of December, I have stopped program development on Atari's
ST/TT, and want to sell a TT 8/100 which I purchased as a developer
just a year ago. I am willing to sell it at the origional developer's
price, or make me an offer:

Atari TT, with 8 Meg RAM, 80M of Hard Disk $2399
keyboard and mouse
with gobs of software is still on it (free)

NEC MultiSync 2A monitor (all but TT High resolutions) $299

Spectre GCR (with 128K MAC ROMs) $299
Lattice C 5 $70
Mark Williams C $50
Alcyon C $25
Neodesk 3.0 $30
Dr T's Tiger Cub $70
Dr T's KCS 1.6 $50
(All software sold with origional manuals.)

The first response at the stated price takes the item. Otherwise
I'll pick the highest bidder. Prices are US dollars, COD.

Goodby's

My decision to move on is based on many factors. The need to develop
some new software with an advanced user interface placed a premium on a
development environment with a good Graphics User Interface environment.
The state of development software on the TT proved crippeling to a couple
of projects, and forced a reevaluation of the platform. The GUI and object
orientation of the Next Computer was found to be the best, and work has been
switched to that platform. Due to what is now recognized as the researchy
nature of the projects, the price and user base of that platform have not
been a problem. Other factors affecting the move were incompatibility of
compilers between the ST and TT (esp. Megamax), the lack of a good symbolic
debugger, and the inability to debug and edit sources at the same time on the
TT.

I have been an Atari Developer for almost 6 years, and the ST has served
me well. My loyalty to the Atari makes me want to share with you to the
new things I have seen. If there is one thing I could underline for Atari
and Atari programmers is the value of having tools developed by a single

software department with resources, rather than assembled in the public domain. I constantly find myself approaching new Next tools with my PD jauntice, suspecting that they are ging to be broken or not inter-operate. But they just work, at least after reading through the documentation! And in 6 weeks of working, the Next has yet to hang or crash! I don't know how Atari could make an environment like this, but I am convinced it is the future.

Yeah, if you want to pay $2000 for a compiler and program in X.

I'm sorry (for posting NeXT stuff in this group), but it had to be said.

>the color-palette yet? I've tried every button in the book and can't
>find it.

Press space bar at the drawing screen, then double-click on the colour to change. Also, click on the big colour square, this gives fill patterns. Colour fill patterns are unnecessary, since you can, eg. fill with a block of any size (not just 16x16 as a colour fill pattern would be). Not sure how to make my own fills yet. Haven't really tried.

At least the GUI has good icons and English names.

From: n160ao@tamuts.tamu.edu
Message-ID: <9017@tamsun.tamu.edu>
Source record: 225850

The MiNT documentation for MiNT .8x says that MiNT doesn't work with TOS 1.0 in ROM. So I got MiNT .9x. I get it to work and even get the "MGR" to work minimally.

The only thing I can't get to work it piping. I always get a out of memory error when I pipe something as simple as this in the Korn Shell.

```
ls -l | grep ttp
```

Both ls and grep are programs less thatn 50K and I have 2.5Mbytes of memory. I don't know if this is a KSH problem, a TOS 1.0 in ROM problem, or if this is simply a probably with MiNT at this point of distribution.

Would someone who does piping send me a note of the results you get with TOS 1.0 in ROM and better versions of TOS.

Thanks Much,
Mark Lehmann

Sorry dude, but the c.s.a.advocacy newsgroup was created to remove
the flamewars that keep springing up, just like this one you probably
started 8-), from the rest of the c.s.amiga.* newsgroups. I
wouldn't take anything from the advocacy newsgroup seriously as
things get to be really emotional and tend to stray from the
facts sometimes. Maybe next time you do read c.s.a.advocacy you
should just read it for the entertainment value like most others do.
Any other c.s.a.* newsgroups should be read if you want to really
learn the true state of things.

One of my partitions got screwed really bad last week too, I tried 'fsck'
and that just freaked out (recursive checking problem I thinks) but as I moved
all the usefull stuff off beforehand I simply wrote the 1st sector of the root
dir will zeros (erased all files) then tried 'fsck' again and it told me I had
lots of problems as It fixed them. 'fsck' seems very clean with only 2 or 3
prompts at the start then it runs of and does the job very quickly - It is
definantly worth getting from then archive-server@uk.ac.lancs.pdsoft .

I tried DLII on the partition first (it might have done the damage) and it
just sat there in a muddle - no use at all.

Anyway my advice is try 'fsck' 'cause it's worth a look at least & very small
& neat.

Dom De Vitto <ddv@uk.ac.bton.unix>
The above is my own opinion and don't sue me if its' wrong (or right).

1455. SM124 information - LONG!

Newsgroup: comp.sys.atari.st
Date: 1992-02-12 12:14:00 UTC
From: Jeroen.Scheerder@phil.ruu.nl
Message-ID: <2103@accucx.cc.ruu.nl>
Source record: 225757

About the SM 124 - an excerpt

Recently I inquired about adjusting the vertical centering of the SM 124 monitor. I got a lot of replies; since I think more people than me might be interested, I am posting an excerpt of all relevant information I received.

First, there are the simpler ways of adjustment, using potentiometers on the logic board inside.

>From Todd C. Miller I received the following information, which he in turn got out of an old ST Report.

=====
FROM: SunFox...

[Complaints about the SM124 tiny screen size deleted]

Before you start wanting to dig around in that Goldstar monitor, a few caveats. First, if you are not electronically inclined or usually stick your fingers in light sockets, you might want the adjustments done by a knowledgeable technician. Second, the voltages off a picture tube can often be around 20,000 volts, more than enough to put your hair on end, stop your heart, etc. There are many convenient places for spiking yourself, so if you work on the monitor, do be extremely careful, I really don't want anyone dying from this simple procedure. Now, on with the adjustments...

For the the little project at hand, you will need a set of screwdrivers, preferably ones suited for extremely detailed work. You are going to be putting the screwdrivers in some very tight places, so they do need to be small. Other than that, ten to twenty minutes are required to complete the project.

Opening the SM124 is a piece of cake. Make sure that the power cord has been removed so that you do not get a nasty little surprise once inside the SM124. You will see five screws holding the case together (like a clam shell). Remove these screws and loosen the case. The back shell of the case will be anchored to the PC board by a small connector from the monitor speaker. Make sure that the big capacitors and other voltage capable points have been discharged with one of the screwdrivers and then simply pull the cable out of the board. You can then lift the shell away and set it aside.

Now look at the back side of the monitor and locate the
flyback (that funky little suction cup on the tube). On the
opposite side of the tube from the flyback will be three little
white potentiometers (all of them with little labels to the side
with VERT. in them). Simply thread a screwdriver into the first
two pots (don't mess with the VERT. HOLD pot, the last one) and
adjust them slowly. You can then plug the monitor power cord back
in, and turn on the monitor to observe the results (if you are
really clever, you don't have to take the cord back off but just
be extremely careful when messing around in the monitor itself
(like trying to keep your hands away from other parts of the
SM124. Adjust the first and second pot until the vertical height
and centering are what you desire.

[This is in my experience incorrect: in my SM 124 there is no potmeter for
VHEIGHT, but one for Vert. distortion correction instead. But look below...]

The second part of this procedure is to center the image on
the screen horizontally, getting rid of those nasty margins on the
left and right parts of the screen. You will not be able to
affect this as much as the vertical (I got the vertical sizing
about 1/8" from the top and bottom of the screen). However, it
does get anywhere from 1/4" to 1/2" margins horizontally, which
still is a noticeable improvement. Take a look at the picture
tube (looking from the back). See the little silver rectangular
box directly below and to the left of the copper threading on the
tube? There is a little potentiometer (like the others) right
there called HORIZ. CENTERING. Somehow manage to get your
screwdriver in there and adjust it until satisfied.

[I might add, there is an adjacent coil of which the core can be turned using
the proper tool (be careful or youUll damage it, itUs graphite - also, it cannot
be turned back and forth more than a few times).]

There are two more pots near the HORIZ. CENTERING pot, called
SUB-BRIGHTNESS and FOCUS. You may want to mess with the FOCUS pot
to increase the sharpness of the monitor, but the other one is not
really important. Now that the screen is set to the desired
vertical and horizontal heights and widths, it is now time to put
the monitor back together. Turn off the monitor, take off the
power cord, discharge the components inside the SM124 and then
reassemble the monitor in the reverse of the process. You're job
is now complete.

[Promises of extreme delight deleted]
=====

Then I received additional info about adjusting vertical centering and vertical distortion
from bbs@actrix.gen.nz. Note that these adjustments are quite a bit more difficult.

====
Have a look at the back of the scan coils that are fited to the CRT neck,
this is the base end of the CRT, you will find 2 ring plasic type magnets,

these have large ears for rotating them, these are the shift magnets.

Note: these madnets are stuck with some white type hard glue, this you
must remove first before you try to turn them, I used side
cutters/wire cutters to remove this glue..

These magnets will let you shift the picture any were you like, one
magnet is for up/down and the othere for side to side..

Note: there is some high voltage on the connectors of the scan coils
and the base connector, so keep you fingers away, also note, there are
some small magnets at the face end of the scan coils, this is were the
CRT flairs out, these are for corner distortion, but first remove them
and then remove the clear glue that they are stuck with,
these have 2 adjustments, rotate and slide..

The best way for checking the ajustment is to draw a full size box with
a small grid, say 10mm and a full circle, this way you can check for
all types of distortions, ie, just like a TV test pattern.
This IS adjustable in the same way the picture is centered on
a regular TV screen.

Bob Retelle offered similar information:

Centering is controlled by magnets around the narrow neck of the
picture tube, and are adjusted by a pair of disks with small
handles protruding from them. By manipulating them (rotating
the disks), the picture can be moved around the face of the CRT
screen.

EXTREME CAUTION must be used, as the adjustment must be done with
the power on, and the monitor operating, which causes VERY high
voltages to be present. Anyone who's never worked with TV
sets should probably NOT attempt this adjustment.

Another caution... in my SM124, the centering disks were glued
to the glass neck of the picture tube at the factory. Breaking
the seal to allow them to be adjusted could be very tricky, to
avoid damaging them or the picture tube. The magnets are also
quite brittle and can be easily broken.

The Focus adjustment should be touched up after moving the
display...

Again... if you don't know your way around a high voltage system,
find someone who does to do this adjustment...
=====

To complete this information, there also was some traffic about correcting
some SM124's habit of blacking out if a relatively small number of white pixels
is displayed.

=====
Peter Knoppers wrote:

This problem was solved in 1988. See the exerpts from an article by
Werner W. Braun, that I include below. I have succesfully applied this
fix (which costs 1 resistor - so it is cheap) twice and it completely
cured the problem.

:... some lines deleted ...

:I decided to take an oscilloscope and did some measurements.
:As far as i know at two places the brightness of a CRT is controlled:
:
: 1) the first gate (hope this is the right technical term)
: 2) the cathode voltage/current.
:
:The voltage between cathode and 1st gate should be constant, by adjusting this
:you can control brightness of the monitor.
:
:Therefore i measured the voltage of the first gate against ground: it was
:constant, so this was apparently not the cause of the trouble.
:Then i measured the cathode voltage, which should be +70V as the schematics say.
:I found these voltage to be screen-image dependant:
: with a light screen i found +70V,
: with completely dark screen i found +85V.
:The cathode current varied between 0mA (no bright, no contrast) and 17mA (full
:bright and full contrast). So i think the problem is a bad regulation of
:cathode voltage. If the load is too small (dark screen or only some light
:characters on a dark screen, the cathode current is small) cathode voltage
:goes up and voltage difference between cathode and 2nd gate goes down --->
:screen fades.
:
:And now my fix:
:Beware --- I'm a simple minded chemist who ownes a soldering iron but is not an
:EE, so i will take no warranty for any side effects of my fix. It works with
:our monitor, but i fixed it today and so have no experience on the long run.
:It's a simple fix and should do no harm to your SM124. What do i do?
:I put a little extra load (1.5mA) at the high voltage transformer, so that the
:current never sinks under 1.5mA and cathode voltage never goes up again. With
:maximum brightness and contrast i measured 17mA, in normal operating condition
:about 8-13mA, so this extra current should never overload the transformer. But
:i give no warranty for this! Be carefull if you turn on full brightness and full
:contrast.
:
:The procedure is given for a monitor manufactured in oct '87, the newer ones
:have a different PCB layout.
:
:1. Open the monitor by removing the 5 screws.
:
:2. Look at the small board which is plugged on the end of the CRT. There you
: find the names of the parts printed. Look for C308 (47uF/100V) at the lower
: right edge of the board. If the board is covered with a shielding, you may
: have a newer monitor and this fix possibly does not apply.
:
:3. Get a resistor 47k ohms 0.25 W and solder it across the pins of C308.

: Put the resistor at the right boarder of the board so that it does not
: touch the monitor box later.
: Pay attention to the small space between the monitor box and the board.
: Possible Damage of your monitor!
:
:4. Close the monitor, cross fingers and switch on. Problem should have gone.
:
:PP: I also found some differences between the circuit drawings and the actual
: board, but this should be no problem. But i supplied R302 with 1k/0.25W,
: but this is not necessary for the fix
:
: part was should be
: ---------------------------------------
: R302 open 1k
: R311 68R 47R
: R312 270R 240R
: R313 820R 680R

I have applied this modification and it works. Finally, Ate de Jong (if I am not mistaken) offered another similar solution, but instead of soldering the resistor across the pins of C308 it is attached between signal ground and B2.

Sorry about this long posting, but since I thought it would be nice to have all this information combined.
Needless to say, donUt hold me responsible for damage caused by doing anything described in this posting.

1456. Used TOS V1.4 Wanted

Newsgroup: comp.sys.atari.st

1457. mgr help requested

Newsgroup: comp.sys.atari.st
Date: 1992-02-12 12:43:52 UTC
From: powers@midiot.enet.dec.com
Message-ID: <33341@nntpd.lkg.dec.com>
Source record: 225756

I have been trying to get mgr up and running on my 4 meg ST, and
am haveing varing degrees of sucess. The documentation seems very
sketchy to me. I can't seem to be able to get all the startup files
right. I am using mint v.91, and have placed that in my auto folder
since mgr needs mint to run. But mint doesn't execute to completion
it looks to run a file called init.prg. So I used the init.prg which
was supplied with mint which sets up the environment variables for
gcc, and mgr in the file init.rc. Then at the bottom of init.rc, I
tell it to run mgr. I get mgr's main screen with the message to press
a key, and I do, and create a window the window runs the shell
init.prg in it, and it tells me that it is unable to allocate the
mouse. Well, the mouse seems to work fine so I assume there is no
real problem there, just a leftover from the original port. Well,
if I try to run any of the supplied mgr programs, like font or browse
it tells me I'm not running in a mgr window. So I thought that
perhaps it had to do with the env variable TERM which was set to
"builtin" as it was supplied. So I tried changing that to "mgr"
because I saw a termcap file which had that as a type. But when I
try to run with the TERM env variable set to mgr, MGR won't start up
it tells me i'm trying to run mgr from itself. I would appreciate
it if someone in the know could shed some light on the correct way
to start up mgr so that it just works, what all the environment
variables are supposed to be set at. This looks like a very cool
package. It looks like it gives one the feel of a workstation on
your st. I'm surprised more people arent running it.

thanks

1458. Mega STE benchmarks

Newsgroup: comp.sys.atari.st
Date: 1992-02-12 12:43:53 UTC
From: kdv_521@eimoni.tuwien.ac.at
Message-ID: <1992Feb12.124353.15987@email.tuwien.ac.at>
Source record: 225758

For those who want to know how fast the Mega STE is, here are the
results from the dhrystone test (I think it was the standard one...):

compiled with: Result: (approx.)

GNU-C 1.40 1663.9 dhrystones/sec
(32 bit int's)

Turbo-C 2.0 3100.0 dhrystones/sec
(16 bit int's)

The dhrystone test source was compiled with register option.

> I'd like some information on Neocept's WordUp word processor, if anyone
> out there has used it recently.

Neocept went out of business last year, and you won't be able to obtain a new version of the program unless it's been sitting on a dealer shelf for a long period of time. Atari has purportedly purchased the rights (and hired the programmer...), although no product is available nor hinted at for the future.

There are a number of word processors out there right now, some which support the HP Deskjet directly. The one I've been using is called WordUp II, from Goldleaf Publishing. It uses the fabled FSM GDOS (to good effect). I've used it to print posters in 90+ point type, and to print disk labels for our local user groups DOMs. The program is a 'document processor', which means that, if you desire certain features such as footnotes, it won't fulfill all of your needs. It also isn't very useful for large novels, etc.

For true 'word processing', Goldleaf Publishing is importing something called, if memory serves, TrueWrite.

Hope this helps.

* FLAME ON!!! *

(Just kidding.)

Seriously, splitting this group further seems like a bad idea to me because it doesn't get a whole lot of substantive traffic as it is. We don't want to divide the group into oblivion, and I fear that as Atari's market share dwindles so will the traffic in the ST newsgroups.

Besides that, the newsgroup creation process is a royal pain.

I would hope that people see me as someone with an objective opinion.
Not nessacarily a doomsdayer.

Anything I gripe about usually has to do with working all day long, with
mainstream machines like the PC and Mac, and comming home to a machine thats
not even on par, like it use to be. Its irratating.

> Perhaps this can lend a bit of insight into the reason that the

I believe its critical for people to discuss all and any forms of computer
technology, including the alternatives, if they are intending to buy.

Whats interesting is the personal attachment we have to all our machines,
PC's, Mac's, and my Mega STE. Its one of the reasons why I haven't been on
a date in over 5 years, if you could call it that. :)

But in the process of exploring all these different machines, I would hope we
all see the impact they are making on us and around us. Not just the ONE we

own and use. Computer technology is spread throughout PC's, Mac's, all the way down to the little XE machine I have, in its influence on all of us.

Its what brings the human sprit together in ways that foster human understanding. And when we have understanding, opressive governments fall for fear is gone, and of course...one can then make the BEST decision...

TO BUY THE COMPUTER BEST FOR HIM/HER.

-Greg

1470. How do you create an extended format using the system calls?

Newsgroup: comp.sys.atari.st
Date: 1992-02-12 18:20:32 UTC
From: mforget@ersys.edmonton.ab.ca
Message-ID: <XgN2FB1w164w@ersys.edmonton.ab.ca>
Source record: 225772
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I am writing a program for the ST that has a "Format Disk(s)" option, which seems fairly simple. Or rather, it is a fairly simple task as long as you stick to the path given and do no try anything different. What I would like to do is format disks using an extended format (82 tracks/10 sectors). The documentation I have doesn't say how to do this, but I'll show what it does say about normal disks and then make some guesses. If I am wrong about something, PLEASE tell me. I would really appreciate any help anyone could offer. Now, to format a normal disk:

1. Use XBIOS #10 (FLOPFMT) to format track 00, 01, 02, 03, ..., 80 for both side 0 and side 1.

2. Zero the first two tracks of the disk. It doesn't say how, though.

(Good docs, huh?) :)

3. Use XBIOS #18 to generate a boot sector.

4. Write the boot sector to track 0, sector 1, side 0 using XBIOS #9 (FLOPWR).

Apparently, that should make a double sided (or single if you only do side 0) sided disk. As for zeroing the first two tracks, I guess they thought it was too obvious to bother explaining. (Grrr.....)

Now, here is where the problems arise. Step 1 seems easy enough to alter for an extended format, and step two shouldn't pose a problem once I figure out what they mean by their instructions. Step three is a major problem, though. This call expects four parameters. The first is the buffer that will hold the boot sector, and the second is a serial number (which is supposed to be randomly generated if you pas $01000000 as the parameter). The third parameter can only be one of five choices. They are:

-1 = Leave Alone
0 = 40 Tracks/Single Sided
1 = 40 Tracks/Double Sided
2 = 80 Tracks/Single Sided
3 = 80 Tracks/Double Sided

Since an extended format doesn't match 0-3, shoudl I choose -1? And how come they told me to format all 80 tracks in step one for a singled sided disk if it only has forty here. I always thought a single sided disk had 80 tracks, but only one side whereas a double sided disk was the same thing but the drive mechanism could format the other "side" as well. Anyway, this is the major stumbling block that I can see.

Any help would be greatly (REALLY GREATLY) appreciated....

>and a TOS file after unpacking it. Which one do I use?
>Any help would be greatly appreciated.
>Thank you.
>

OK as I remember it there are two executable files:-

PRL.TOS
SPICE.TTP

PRL.TOS has to be run before you run the SPICE.TTP program, if you don't
then I seem to remember that SPICE.TTP crashes or won't load. I'm not
exactly sure what the PRL.TOS does although I have a sneaking suspicion it
must install some routines used by SPICE.TTP(?).

Anyway I usually have the PRL.TOS in the AUTO folder for bootup..

Then you can run SPICE.TTP, don't bother about any parameters because I'm
not sure what you can do, I could never get them to work. The screen will
go blank as the program loads and then the prompt 'INPUT:' appears. Type
the full pathname of the SPICE sourcefile you wish to simulate and press
return. Then a prompt 'OUTPUT[CON:]:' appears, you can do two things
here either type return and the output goes to the screen (console = CON:)
or type the pathname of the data file in which you want to put your simulation
results.

Hope that helps.

I've used that version of SPICE myself for some projects and have had no
trouble. Its not too slow, (but not a patch on a SPARC IPC running HSPICE!).

ehohnbau@Bonnie.ICS.UCI.EDU writes:

>What is the highest skill level achievable in Dungeon Master?
>Has anyone broken 2nd level master?
>Does it go all the way up to 6th level?

What do you mean 2nd level master?
Is this 2nd level as in master with the 2nd spell power symbol?
I've got some guys on the 9th level (of the dungeon, 2 of them) who would be 4th level master's.

BTW: keep killing the boars in the end room to get food + experience.
walk to the skull key stairwell and back and they will have re-appeared!
I've got 7 chests full of drumsticks, which are the lightest and most
nourishing food.

> >The TT's 32Mhz 030is quite SLOW compared with the potential Dave Small's
> >SST board, which can clock 40Mhz reliably, I have even heard he has
> >tested the SST at 50Mhz with no problems.

But ... speed isn't everything - is it? Will you ever get UNIX for your SST?
See?

And ... the TT comes with 4 serial ports, a _real_ SCSI-port (just hook up
anything you want), a quite good graphics resolution for black&white purposes
and and and ... not to mention the new TOS and the Multi-TOS to be released
at the CeBit fair ... (think I could continue for quite a while :-)

I'm quite happy with my machine.

BTW here in Germany they sell like sliced bread :-)

Cheers, Paddy

Message-ID: <1992Feb13.023606.22270@demon.co.uk>
Source record: 225780

Neocept who produced Wordup went down the pan some time back. It is available
as version 3.x from various sources. Atari germany bundle it and I believe
it can be bought in the States mail order. V3 is very buggy though. I use V2
with a PD spell checker called checkup which is superb.
Wordup uses GDOS so the output is as good as any GDOS based program i.e. OK
but not postscript quality.
I like Wordup very much and it does everything I need except for multiple
columns although even that can be done via some fiddling. It gives multiple
fonts/italic/bold/outline etc., many graphic import formats (GEM format is
a bit buggy), nice interface, WYSIWYG, good text expansion facilities i.e.
I enter 'address' and hit ALT E and it turns into my full address in a nice
font plus todays date, and many other things.

I'm looking for a good site to get BBS support files... atari.archive.umich and wuarcive appear to be dry of these files for the most part...

I know that thier are hundreds of these files available, but I don't know where to look as far as FTP sites...

I would use my GEnie account to get the files but thier is not a local GEnie number where I live now...

Any information would be appreciated...

1485. Looking for upgrade patch for Word Up 3.0

Newsgroup: comp.sys.atari.st
Date: 1992-02-13 05:44:06 UTC
From: millerm@CS.ColoState.EDU
Message-ID: <1992Feb13.054406.23876@yuma.acns.colostate.edu>
Source record: 225778

I heard from a local dealer that there is a patch for Word Up 3.0 to upgrade it to ver. 3.01 or 3.02 (something like that). The guy said that this upgraded version works on all STs. I contacted Bob Brodie on the F-Net (he now has his own board on the F-Net) and he said that the patch does in fact exist on GEnie. I do not have an account on GEnie myself, but I'd love to get this one patch program. It seems that just about everyone I've talked to has never heard of this patch. I've looked on about 4 ftp sites that I know have ST stuff on them. It wasn't on any of them. I have also checked the BBSes I call and they don't have it either.

Incidently, Mr. Brodie actually offered to patch my disks for me if I would send them to him. I am considering doing this if all else fails. The only disincentive I have for doing this is he said it would take him about a month to get to it, since he is understandably busy. I would much rather get it faster than this if possible.

Despite its problems I still like Word Up. It works for me as long as I don't delve too much into its advanced features. The reason I am so tolerant of its problems is I got it at a bargain price, since the dealer was trying to clear out his stock of it. Would some kind soul please upload this patch to atari.archive, post it to comp.sources.atari.st, or e-mail it to me, if you can? If you e-mail it to me, I'll post it to atari.archive.

>to a few DeadHard Atarians?
```

I am sad to see Horizon Computers go too. I got my first computer, an Atari 130XE, from them in 1987. I knew the people who ran the store to be very honest salespeople. They would encourage me to buy a piece of third-party hardware or software if they knew that it was better than an Atari product.

Several years ago they started selling PC clones as well, and have been up through the present. They have been doing this to try to stay in business. Apparently this has not helped them at the present time. With the recession, this could be understandable. They will be closing shop at the end of this month. They have heavily discounted their already discounted prices in order to clear the stock out.

With this sad story, I say that hope is not lost in Colorado. There is at least one other dealer that sells Atari and PC clones. It is Run-PC, based here in Ft. Collins, CO. I got my Mega STe from them. They sell all of the STe/TT line, including the Discover Xtra and Family Curriculum packs, and the Lynx game system. Run-PC also does mail-order. If you get Current Notes you may have seen their ads in recent issues. They have also gotten some publicity in the popular media. A local NBC-affiliate in Denver did a spot on Run-PC and focused on the MIDI systems they were selling.

In addition, I have read that the CompUSA chain of stores is currently selling the Portfolio, and is expected to start carrying the STe line as well, in the near future. There is, I've heard, a CompUSA store in Denver.

I think I know the program you're looking for then. There is a
program on atari.archive that I got a while back called specshow. Two
of its options are to "smoosh" and "unsmoosh" Spectrum files. It's
main function is to be a slide-show program that displays any Spectrum
pictures you may have on a disk. It also has the feature to animate
a series of Spectrum pictures (if you have a set that are meant to be
displayed together, one after the other). Actually, it may very well
have the ability to display smooshed files, since it offers this
function in the first place.

This request is one that I have been considering making for quite
some time. Instead of sensibly making it like Mr. Wittstruck has, I have
fooled around trying to decipher the small amount of information I do have.
(This includes "Internals" (3rd ed.)) I am not a novice assembly program-
mer, but I have struggled (mostly unsuccessfully) with the ST for a long
time. I just ordered a new book by Clayton Walnum in the hopes it would
yield some better information, but there is no better way to learn how to
do something than to see how it is done! Code that works, written by
people who don't mind posting it would be a godsend. If anyone responds
to Mr. Wittstruck, please consider sending a reply to me as well. It
would be greatly appreciated.

>about the ST, at least we have a bit more hope. Even doomsayers like me,
>Greg Carter, and Bob_R_ still think there is a chance.

You have to take the people in c.s.a.a. with a grain of salt. Those are the
die hard complainers, people who complain for a life :) People quite often
defend the machine, all too often. The majority of doomsayers are people that
want indigo's inside their amiga for $.50, and anything else means it will
die. (i.e. irrational expectations) I don't think you spent enough time on
.advocacy to sort through the garbage.

> Perhaps this can lend a bit of insight into the reason that the

>for them. So just ignore them, and give your condolences. And for god's
>sake, don't send them over to c.s.a.a.. That's what got them riled up in
>the first place!

This assesment is totally preposterous. When i look through c.s.a.st all i
see is "help with dungeon master" "st for sale" "need help with x bug", etc..
etc.. now granted this is saying nothing about the st people, but as a mainly
amiga person these things stand out at me. Most other amiga people would also
see these things, so the assesment of "happy people in st-ville" would not be
aparent to many amiga people (not to say there aren't, just that amiga people
wouldn't see many of them). Here is the basic reason there are so many flames

to c.s.a.st:

The amiga is a technically superior machine in many (not all) areas to many (not all) computers. Amiga people often get frustrated when they see what looks to them as people making stupid decisions (not to say buying an st is stupid, it's not if it suits your needs) based on 1) bad information, 2) product loyalty, 3) what seems like a market oppression to force CBM out of business. There are others, but i won't go into them (since this is an atari newsgroup). Just suffice it to say that the flames you see are merely the result of frustration, not jeolousy or anything like that. I'm sure many st people have experience equal frustration in the past, it's just that there aren't enough st advocates out there. most st users have come to the realization (long ago) that Atari may never go anywhere, not to say it won't, just that many st users don't want to get high hopes, after being let down so much.

Anyways, don't flame me for posting it here, as it was an Atari user that originally posted this, i'm merely giving my opinions.

It just shows that the machine is being let down by the lack of (a) really
good development tools and (b) Good and "flashy" applications.

I agree with Warwick, the TT is a marvelous development tool.. I don't use
MW2, but I do have a machine which can be used to develop good code quickly
and efficiently. (I use MiNT + my init(8) package + tcsh + gcc)

It could well be that the ls you are using doesn't free up the memory it doesn't need, therefore there is no memory left for the grep program. A not so satisfactory solution is to set the ulimit using a MiNT util (or it may be built into the shell). Please don't ask me for more details as I don't use ksh and can't remember if there is a util for doing it in the MiNT utils currently available (from where I don't know).. sorry.

1494. Re: Highest Dungeon Master skill level?

Newsgroup: comp.sys.atari.st
Date: 1992-02-13 11:38:24 UTC
From: okes@solb1.essex.ac.uk
Message-ID: <OKES.92Feb13113824@solb1.essex.ac.uk>
Source record: 225791

In article <9202102010.aa24770@Bonnie.ics.uci.edu> ehohnbau@Bonnie.ICS.UCI.EDU writes:

> What is the highest skill level achievable in Dungeon Master?
> Has anyone broken 2nd level master?
> Does it go all the way up to 6th level?

I believe that the highest level attainable is ARCHMASTER.
I read this in the UK mag ST ACTION 2 or 3 years ago.
The best I have had is 5th level master. This was quite strong enough
to beat up anything in DM or CSB. Going any higher is, IMHO, a waste
of time.

The simplest way of using floppies on both machines is to get a program for the Amiga to read IBM floppies. There is one on lancs.pdsoft.ac.uk called MSH V1.3.

A TT030/8 in the UK costs about 8000DM, so now you know why Atari UK
have sold hardly any TT's over here. Why can't we have parity with Germany!

1497. ST <-> Portfolio file transfer needed

Newsgroup: comp.sys.atari.st
Date: 1992-02-13 11:58:26 UTC
From: ellmenre@peschl.uni-passau.de
Message-ID: <1992Feb13.115826.6240@forwiss.uni-passau.de>
Source record: 225794

I am looking for a PD-program which manages file transfer
between Portfolio and ATARI ST using the parallel port.
The only program i know is stfoli in atari.archive.umich,
but it is limited to max. 10 kB files, which is even for
the portfolio not enough.

So, does anybody know an FTP-Site or another place where
i can get such a program?

Thanks for help!

Nils

1499. SM124 help !

Newsgroup: comp.sys.atari.st
Date: 1992-02-13 13:23:56 UTC
From: samm@aisb.ed.ac.uk
Message-ID: <SAMM.92Feb13132356@lime.aisb.ed.ac.uk>
Source record: 225799

I've just got hold of an SM124 (second hand) and managed (*ahem*) to bend back the audio out pin on the plug. This snapped off entirely when I tried to straighten it. What puzzles me is that I can't get a picture either (though the screen flashes when the ST is turned off). Does anyone know if the audio pins should affect the video ? Is this a separate fault, and will removing the audio IN pin help at all ?

I know I sound a complete klutz, but any help would be much appreciated.

Sam-the-kak-handed.

Erik> irrational expectations) I don't think you spent enough time on
Erik> .advocacy to sort through the garbage.

Yep. The group was created as a forum for people to complain or post
rumors or flame something they don't like or debate other computer
systems. Drawing conclusions about the Amiga from the posts in advocacy
is similar to going to an unemployment line to ask people about the
economy or hanging around a manufacturer's complaint dept to ask about
their products and then expecting to get an objective overall viewpoint.

> Perhaps this can lend a bit of insight into the reason that the
>amiga folk often post over here. They read comp.sys.amiga.advocacy, get

Almost to the point of being comical.

Erik> <description of how someone could easily get the wrong impression
Erik> from c.s.a.st deleted>

Erik> Here is the basic reason there are so many flames to c.s.a.st:
Erik> <good analysis of things that frustate Amiga owners deleted...>
Erik> Just suffice it to say that the flames you see are merely the
Erik> result of frustration, not jeolousy or anything like that.

I agree, this seems like a *much* more plausible theory than jealousy.

FWIW, the reason I personally read the ST newsgroups on occaision is
that I used to own one (which I sold to buy an Amiga 3000) and I'm still
interested in what's going on in the Atari world. The ST is not a bad
machine and I typically do not flame it. I also think that the majority
of Amiga owners are not hotheads but that there is obviously a very
vocal minority of immature users.

Erik> I'm sure many st people have experience equal frustration in the
Erik> past, it's just that there aren't enough st advocates out there.
Erik> most st users have come to the realization (long ago) that Atari
Erik> may never go anywhere, not to say it won't, just that many st
Erik> users don't want to get high hopes, after being let down so much.

Yup. I know felt that way when I owned one.

I think the ST user community is a very cool group of people, in
general. There is definitely a very supportive and friendly atmosphere
toward other Atari users. There are also many talented ST hackers, look
at Hacman, Opus, MiNT, GCC, Gemini, et al. I wish Opus ran on the Amiga.
(Is source code for Opus available, BTW? ;-)).

The Amiga user community is very similar, you just wouldn't know it by
reading advocacy or the flames some of the idiots post here.

It's too bad there isn't more cooperation between the ST users and Amiga
users, because both groups face similar problems ("nonstandard"
computing platform, "toy" image in public eye, manufacturer doesn't know
how to market machine properly, uneducated computer buyers ignore
machine because they haven't heard of it or don't understand it, etc).

I'd like to see some joint software development or some GEM<->Intuition
libraries for porting stuff rather than flame wars. Everyone would
benefit in the end. (Send e-mail if you have comments on this idea!)

Erik> Anyways, don't flame me for posting it here, as it was an Atari user that
Erik> originally posted this, i'm merely giving my opinions.

ditto.

Following multiple requests, here's a short tutorial on how
to use the block options in crackart:

Grab a block by hitting ESC anytime in the drawing mode. You get a
white crosshair. Position it at the corner of the square you want to grab.
Hold down leftmousebutton and drag to other corner of block square.
release button, and when you move the mouse, you'll notice the block comes
with you. The block is now your pentip and will obey many drawing
commands including circle, frame, line, etc., but not any options that
require a fill (disk, polygon, box, etc.). You can now use any of the
neat distortion functions to the right of the menu screen on that block,
and when you go back, that distorted block will go where you like. All
the functions to the top right of the screen also affect block placement.
Any time you want the normal drawing mode back, hit the paintbrush icon
on the mainmenu, and the one to the left of it for your block back.

A great program. Certainly one of the best and fastest I've ever used.
Remember to liberally use the rightmousebutton for hidden options, not
the least of which color select in magnify mode. Fastfast.

Is all.

From: univwa@sbusol.rz.uni-sb.de
Message-ID: <16215@sbsvax.cs.uni-sb.de>
Source record: 225796
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech,de.comp.sys.st

Hi there,

I ran into a problem which is very disturbing...

I cannot achieve to start GEM programs under MiNT/tcsh; even after
changing to the path where the application is at home with all files
I get a dialog box which says: 'Cannot find RSC-File'.

I already tried to have the PATH also set to /rsc and to place there
all the RSC's which can't be found, didn't work...

Next, I tried to change to the path where the GEM application lives and
reset the path to"set PATH ."; was useless...

I'm using a TT030/6/200, Mint 0.92, tcsh is Eric Smith's port of tcsh 6.01.00

Any good advice???

greetings Bernhard

OK.
I have been coding in Assembler on the ST for about 2 years now,
and found it very easy. Having progressed in leaps and bounds, I now have
several disks full of the subjects below.

If anyone want to send me a disk, and a request then I would be
happy to return copies to all who want them. I would post them but I am unable
to get ST stuff uploaded - sorry!

I strive for at least 50hz rate. That means CARAMEL smooth stuff. So far I
have routines, fairly well docuented to do the following

1) Scroll the whole screen, in 2 planes in any direction.
2) Play samples with a realtime spectrum analyser at 24khz
3) Horizontal scrollers - straight/waveform
4) No-Lower border interrupt routine
5) Lots of timer-B rasterinterrupt routines
6) Parallex scrolling (3 overlaid layers - 1/4 of the screen)
7) Scroller that rotates away from you as it goes by
8) Distort 2 images in 4 bitplanes, each 1/4 the size of the screen
under realtime mouse control at 50 frames a second. (My favourite and
the one of which I am proudest)
9) 'Normal' Distortion
10) Vertical scrolling of the screen (whole screen in 2 planes)
11) Full screen scroller. Each letter about a screen big. Letters generated
ie: not pre-drawn
12) As above but half speed and half screen, with rasters
13) Bounce a 4-color grid (2/3 of the screen) around over a static
background image.
14) Bouncing 'planet' logo - 4 planes, 1/4 screen while also rotating
an image at the top of the screen. By 'rotating' I mean as if it
was wrapped around a cylinder which is turning away from you.
15) Playing Quartet music under interrupt while scrolling whole screen
in two planes - any direction (even diagonal)

Thats the main stuff. I only code in my spare time, for fun.
Anyone welcome to send me a disk. If you like you can post it on the net
as well, so long as I'm mentioned in the source....

Umm... just a quick note - many of these use 'illegal' code to get the
best out of the machine. Most use my own VBL detect routine which
wont work on an STE.
All are actually convertable though, so I leave it up to you.

Also, they are all DEVPAC source codes.

Send disks to:

Edd Deegan
38 Crescent Road
Burgess Hill
West Sussex
England
RH15 8EG

I will send them back the following Monday from when I get them.
Enclose a self-addressed/stamped envelope.

Those disks with software already on them will probably get priority!!!!!
(Share and share alike you know!)

Any questions - eg 'how do I?' then E-Mail

vatec@uk.ac.pcl.sun

Please note.... this is NOT a formal arrangement! I'm only doing it cos
I like the idea. No charges will be made by me for this, I expect to get
no profit, and all I ask is that if you publish/post my sourcecode, even
modified (I give permission for this) then I get a mention!

Enjoy.

Edd Deegan
vatec@uk.ac.pcl.sun

From: dalessio@rtsg.mot.com
Message-ID: <dalessio.697999845@feldspar22>
Source record: 225711

I am going to be selling my ST and hard drive so I can
upgrade to a new ST. What are the going prices for these?
Here's some info:

Atari 1040STf, 1MB RAM, internal floppy, TOS 1.0
(basically, a stock 1040ST) with mouse.

Supra 30MB hard drive. The controller and drive were replaced
by Supra after I experienced a crash, so they now have the
newer controller.

Thanks in advance for all replies.

1508. Let's have more info on MGR!

Newsgroup: comp.sys.atari.st
Date: 1992-02-13 17:05:00 UTC
From: MORGADO@VXDESY.DESY.DE
Message-ID: <01GGH9T52MAO90N9YD@vax58b.desy.de>
Source record: 225797

I would like to support the request by Bill Powers for more information on how to set up MGR correctly. I have successfully run it under MINT 0.91 and was able to run several .ttp programs on seperate windows. A few questions/problems remain. I can't run BROWSE or FONT, or should I say they both run but with no apparent effect! What about all the icons that come with MGR, what are they for? Has anyone any experience on what the best shell is to use with MGR. I am running BASH at the moment and it seems to be ok, apart from the fact that sometimes windows, or even the whole system seems to hang, tends to happen when I run CLOCK or CLOCK1 or some .ttp program which uses a significant portion of memory. Any suggestions?

Another problem I have found is trying to read the manuals which come with UNIX type software! Since I don't have access to a UNIX box I am reduced to editing each manual file by hand and removing what appear to be some form of formatting commands. Does anyone have any suggestions as to how to view these properly on the ST, or even coverting them to postscript so that I can print them out on a laser printer?

Thanks in advance for all your help.

PS. to all those who read my post on getting all three resolutions on SM124 using purely hardware, I am at the moment looking at a copy of ST Computer and will be attempting to get hold of the relevant back issue as soon as I can understand the German order form.

1510. A couple of questions

Newsgroup: comp.sys.atari.st
Date: 1992-02-13 17:32:31 UTC
From: cczcole@unicorn.nott.ac.uk
Message-ID: <1992Feb13.173231.29619@cs.nott.ac.uk>
Source record: 225701

Hello all,

I've a range of questions for which I'd more than welcome some net.wisdom
- I hope someone out there can help out (if you want to send email, please do
so and I'll summarise in the fullness of time....).

1). Overscan.
I've just read an ad. for the Overscan hardware mod., which claims that
if it finds itself incompatible with a piece of s/w it'll revert to a 'normal'
screen - is this true in practice? Anyone know of any software that absolutely
won't run if Overscan is fitted? What machines have people got it successfully
installed on (anyone put it on a MSTE?)? Would anyone recommend the product
(I'm just being cautious here before taking a soldering iron to my machine!).

2). Mega STE.
Anyone in the UK got one yet (that they haven't had to send back - there
was a magazine report a month or so back that said the first shipment had to
be recalled because the modulator would only work on mainland Europe!).
Anyone got any incompatibility problems? Has anyone made any timings to
show just how much faster things run over an ordinary ST(E)? For some reason
I have doubts about figures published in magazines....
Would the TT multi-sync monitor work on a MSTE; or would anyone care to
recommend a particular, and cheaper :-) multi-sync instead?

3). Keyboard electrification mod
Anyone know of a hardware hack to do this so's when I leave my machine
unattended for short periods, eg. to get a drink, relieve myself of a previous
drink, etc., I don't come back to find my cats have reprogrammed the thing
\{smilie} (before I get reported to the RSPCA) - it never seems that by walking
across the keyboard they've pressed keys merely at random :-)

PS. Hello to Ralph Sobek; any chance of getting that degas2ps you said you'd
got onto atari.archive (or irisa.irisa.fr)?

Cheers, and many thanks in advance,

Marlon Cole email: cczcole@uk.ac.nott.unicorn or
Cripps Computing Centre cczcole@unicorn.nott.ac.uk depending...

Um, I don't mean to gross you out while you're eating, but those are
giant rats! I remember seeing drumsticks lying around after I killed
my first rat, and realizing "So that's what I've been eating all this
time..."

>I've got 7 chests full of drumsticks, which are the lightest and most
>nourishing food.

Actually, the most nourishing food is a dragon steak, but
unfortunately (or fortunately, depending on how you look at it), the
dragons don't regenerate in DM. Worm rounds have the worst weight to
nourishment ratio. I'm partial to screamer slices, myself.

Too bad you can't eat your party members when they die. Mmmm!

Hello everyone. I just received a little card from the friendly
folks at WordPerfect. They want me to "trade up" my Amiga version of WP
and buy the DOS version for a "special limited offer." They are sending these
to any registered user of Amiga, Atari, or Apple II WordPerfect. I have some
advice for all of you, like me, who are fed up with WP's intransigence.

SEND IT BACK!

That's right; send it back to them in the mail and send a letter along with
it telling them you don't like how they are treating you. I hear the
Windows version is selling really badly, and there is some talk that the NeXT
may be having similar problems. Don't take this lying down anymore! When you
get your little card from WP, send it back!

There are at least two vesion of the SM124 on the market. An old one with
a linear powersupply with a huge transformer and a newer one with a
switchmode powersupply and a different main circuit board.
These two monitors are completely different inside. The older one has a lot of
transistors wich are replaced by a IC in the new one. The partnumbers
in Jeroen Scheerder article may therefore not match your monitor.

>`--------------------------------------------------------------------------'
```

So much of your note appears to be the result of rational thinking that I can't help but be disappointed by the fact that you didn't quite carry your analysis through to it's logical conclusion. You contend that most ST users realize that Atari is going nowhere. I contend that most Amiga users realize that Commodore is going nowhere. IBM compatible and Apple machines control the market. There are millions and millions of these kinds of computers out in the marketplace. Software developers are going to develop for the machines that dominate the marketplace. So anytime someone buys an IBM compatible or Apple computer instead of an Amiga, they have made an intelligent decision. They may not have based their decision on this fact, but neverless there final decision provides them with a machine that will be well supported. Atari's and Amiga's will never be well supported. Argue as much as you like, but this a cold, hard fact.

So what does the supposed Amiga technological advantage buy you? Not a whole lot. It's similar to buying a cordless drill. It's portable, and has as much power as a drill that must be plugged into the wall. But what happens if you can't find batteries for your cordless drill? Now you have a cool tool that doesn't do much. The Amiga falls into the cool tool category. If you could find as much software, and as much technical help for the Amiga as you could for the IBM, I would never recommend that anyone buy another IBM. Unfortunately this will never be the case. Too bad because the Amiga really is a nice machine.

Message-ID: <odaiAvS00YVX83YmYX@andrew.cmu.edu>
Source record: 225715

Man, I had no intention off stirring up such a kettle. I posted for the sake of the folks here who get irritated at all the anti ST, long live the amiga posts over here. It was not to flame the amiga, or to boost the ST. I was unaware so many amiga advocates read here. Why do you, anyway? Hmmm.... Anyway, shut up already. I take it back, all the posts at c.s.a.a are about how great tC= and the amiga are, and the ST sucks. The amiga is the best machine on earth, is marketing IBM and Apple into the ground, and Atari will be liquidating and filing chapter 11 tomorrow. So shut up already.

mark

PS, I never said nor implied that the posts here at c.s.a.st were happy and gay, mearly that most saw a silver lining through the storm. Man some o' y'all need a class in reading comprehension. OK, I'll shut up too.

mark

1522. ST hardware for sale

Newsgroup: comp.sys.atari.st
Date: 1992-02-13 22:44:38 UTC
From: houlton@CS.ColoState.EDU
Message-ID: <1992Feb13.224438.63307@yuma.acns.colostate.edu>
Source record: 225716

Since my Mega2 bit the dust, I find myself with some Atari hardware I
can't use. If you're interested, make me an offer:

```
Hardware asking (hoping) price
-------- ---------------------
Atari MegaFile 30MB HD $275
Atari SC1224 Color Monitor $125
Joystick > shipping costs
Falcon,KingsQuest3,
Revolver, assorted other SW $35
```

All serious offers will be considered (Serious defined as "> shipping costs").

Everything has original boxes, manuals, software (HD). Bought in '89.

Check again Mark, you CAN use the block for most operations that require
a fill (you can even use fill with a block). They tile the block.

>
> Turbo-C 2.0 3100.0 dhrystones/sec
> (16 bit int's)

it would be nice to see -mshort (16-bit) in gcc as well. as i have
said a zillion times, dhrystone is often more a test of a compiler
than a machine. consider the above "proof of concept". also, pls
mention all compiler switches used (and read about the ones available
so you can try others - gcc has a bunch of options besides "-O").
try inlining. this will make whetstone run 2x faster on some boxes.
report the dhrystone version. v1 give numbers about 2x higher than
v2.0 or v2.1, for example. when giving bm results, it is better to say
more than less. finally, if possible, try sozobon as well, with
optimization (and without). recall that alcyon gives about 800 dhry/sec
a 4:1 difference on the same box. caveat user. compile times may also
be of interest to round out the report.

thanx for this info, tho...

Organization: New Mexico State University

Hello everyone. I just received a little card from the friendly
folks at WordPerfect. They want me to "trade up" my Amiga version of WP
and buy the DOS version for a "special limited offer." They are sending these
to any registered user of Amiga, Atari, or Apple II WordPerfect. I have some
advice for all of you, like me, who are fed up with WP's intransigence.

SEND IT BACK!

That's right; send it back to them in the mail and send a letter along with
it telling them you don't like how they are treating you. I hear the
Windows version is selling really badly, and there is some talk that the NeXT
may be having similar problems. Don't take this lying down anymore! When you
get your little card from WP, send it back!

> I'm trying to find out more about the TT, how fast is it? chip? price?
> models? graphics support? anything you can tell me.

Well, the TT is about 6 times quicker than a standard ST on memory
exchanges (8 times if you have TT-Ram). The boost is far superior either if
your program uses the 882 for math purposes (a least 100 times faster) or
the application is made of small loops that can be stored in the cache.
The TOS itself is not very much quicker (250 % if I remember). This is due
to sucky EPROMs (150 ns access time !). One way to improve that is to
copy ROM in RAM and redirect the addresses with the PMMU.
TT incorporate 4 RS-232 compatible lines, out of which 2 can be used for
high rate serial channels (Appletalk, HDLC) ; it has a true SCSI bus,
built with the NCR 5380 chip ; also there is a limited VME bus (D16/A16)
for extension boards. You have also all the features of the standard STe
model. Lastly, there is a 44 meg sucky HD, which can, hopefully, be easily
changed.
The video incorporates new modes. The old St ones are still present, plus
one 320*480 (256 colors), 640*480 (16 colors) and 1280*960 (monochrome,
needs a special 19' monitor). The video connector is now a standard VGA
one. The old ST monitors (SM 124,...) won't work.
Regarding the hardware, the TT features :
A 68030 full 32 bit microprocessor with PMMU and cache at 32 MHz.
A 68882 enhanced IEEE-mathematics coprocessor at 32 MHz.
2, 4, 8 or 16 Mbytes of Ram.
A 5380 SCSI chip.
A Z85C30 (?) Zilog SCC controler for high speed serial channels.
Two MFPs 68901, one of them being compatible with old STs.
A new 64 bit video shifter.
A new GLUE chip called TT-MCU.
An enhanced WD 1772 chip which is designed (?) to support 1.44 Mb floppies.
(A new floppy controler called Ajax will soon appear for 2.88 Mb drives).
Two fast DMA controllers for SCSI and high speed serial channels.
And all the STe harware.

The software is more or less compatible, let's say no GFA programs run
(Except if you use a patch on atari.archive), some work fine (Those compiled
with TC 2.03 e.g.), and many games crash.

I got my TT for 9000 FF ($1600) but that was a special offer.

Hope this could be useful.

Enjoy,

Vincent.

Hi here,

as with every other program changes of the environment *after* the program has started have no effect. So you have to change PATH *before* AES starts running.

J.Reschke published an auto-folder-program doing this in the german mag ST-Computer some time ago. At that time, it was my only possibility to work with the environment.

When I got Gemini, I first thought, I would never have to use it again, but then I ran into the same problem as you described above. So I reactivated it, and now I use it to set PATH and other environment variables to be read by ACC's.

If there is enough interest, I'll dig out the sources and mail or post them.

greetings Klaus

1534. Problems with Emacs 18.57

Newsgroup: comp.sys.atari.st
Date: 1992-02-14 10:06:44 UTC
From: sms@sys.uea.ac.uk
Message-ID: <2147@sys.uea.ac.uk>
Source record: 225734

Could some kind soul help me with Emacs 18.57 as I have completely failed to get it to run on my system...

I have just tried to get the full Emacs (18.57) for the first time and I'm having a bit of a problem.

My setup is a TT030/8 with a 105MB HD.

I downloaded the zoo file, unarchived it as instructed, fixed the stack size to about 800K and then dumped it.

That all seems to work OK. However I then have major problems with TERMCAP in that I have to have my teminal entry on one single line... it doesn't seem to like descriptions split onto separate lines using the usual method (I tried two other TERMCAP files which were distributed with ST things... Curses and MiNT I think). Sometimes I can finally get past the "your terminal type 'xxx' is not powerful enough to run emacs' etc. message. However when I do I get a bus error.
This happens under both plain TOS and MiNT.

I tried running it on my bog standard 1Meg ST (using a dump with a stack size of about 150K) but failed to get past the terminal type problem. I'm not really interested in having it working on my ST as I have no HD so it's not viable but I just thought it might be interesting to check it. Anyway, I gave up after a while as I was getting just a bit cheesed off with it.

For reference the TERMCAP problem is not being able to position the cursor (or so emacs reports). If it's needed I can give more specific info on the crash (I think) but it's definitely a bus error.

Hope someone can relieve my misery...

Steve Sowerby (sms@sys.uea.ac.uk)

1536. MetaDOS: When, where...?

Newsgroup: comp.sys.atari.st
Date: 1992-02-14 12:00:48 UTC
From: jonal@sofus.dhhalden.no
Message-ID: <jonal.3@sofus.dhhalden.no>
Source record: 225747

At last: FSM-GDOS is on its way to the shelves & HDX 5.0 is available.

But: Where is MetaDOS? It's about time that we get the CD-ROM drivers so that CD-ROM projects can be made for the Atari. There are a few discs out there already, but with the soft & hardware not being widely distributed yet not many of us can take advantage of 'em.

Atari: get this thing on the streets _NOW_! We really need it. And, make a Atari branded drive with DMA port. Even if it will be more expensive for the end user, we will at least have a standard and a proof that it really is available for all of us. Apple's CD SC player is way more expensive than third party ones, but still sell well. I'd personally preferred an Atari branded drive, it feels more secure that way (YES, I STILL HAVE FAITH IN OLD ATARI CORP....).

Also, when you get at least MetaDOS on the streets, make the developer documents & software available on CD. We'll save a few trees, it will be cheaper to make (cheaper to get?) and shipping costs will be much lower for all of us. Get it?

If anyone has a complete listing over Atari compatible CD-ROM discs (I know there has been a few PD compilations plus at least one game), please consider mailing it to me. Hints about availability, cost & sources would be appreciated!

There is one nice feature with WordUp III, you don't have to use GDOS,
you can use the fonts that are in your printer, but some of the programs
features are disabled when you do this..

1540. Improved GNU emacs 18.57 port

Newsgroup: comp.sys.atari.st
Date: 1992-02-14 12:47:22 UTC
From: lynbech@daimi.aau.dk
Message-ID: <1992Feb14.124722.6040@daimi.aau.dk>
Source record: 225748

I have applied Howard Gayles 8 bit patches (ported to 18.57 by Thomas Bellman)
to version 18.57 on atari.archive.umich.edu.

It has been uploaded to funic.funet.fi, and I will upload it to a.a. as soon as
I'm able to connect.

When downloading, remark that a new version of zoo is required, and UNIXMODE
should at least be set to LA, since some file-names are long.

Below is my readme file included.

```
------------------------------------------------------------------------------
Christian Lynbech

DAIMI office: R0.32 phone: 5034
University of Aarhus,DK-Denmark email: lynbech@daimi.aau.dk
------------------------------------------------------------------------------
EMACS, The One True Editor

==============================================================================

readme.1st:

This is a small improvement over Scott Kolodzieski's port of version 18.57 of
GNU Emacs. The improvemnet is that Howard Gayles 8 bit patches has been
applied. This gives a real slick and flexible handling of extended character
sets.

The zoo file should have been extracted with unixmode of at least AL, meaning
automatic creation of symbolic links. Some names are, especially of the lisp
files are pretty long.

Documentation included in this distribution is Scott Kolodzieski's original
readme-file, and Howards Gayles readme-file for the 8 bit patches. Consult
these for further information. Remark that the handling of 8 bit characters is
different from that described in Scott Kolodzieski's readme. Also note, that
some of atari's extended characters does NOT conform to the iso8859 standard.
This is a concern if you use latex and the iso8859.sty.

Only the lisp files needed for dumping is included. Get the file 1857elisp.zoo
if you want to do any real work. This also goes for Howard Gayles lisp files.
If you plan to do any 8 bit stuff, then get it. The sources is distributed in
the file 1857src8b.zoo.

temacs has been compiled with a stacksize of -1, meaning that the resulting
emacs will grab all available memory in the system. This makes the most sense
to me and my 1 meg 1040ST. Use the supplied tools to correct the stack, if you
want to have emacs leave room when starting.
```

Remark that in order to have emacs find the startup-file .emacs, this file must be located in the directory pointed to by the HOME environment variable, and the USER variable should be set to unknown. To fix this either patch the file startup.el, or add the definition
(defun user-real-login-name () (user-login-name)) to your site-init.el file when dumping. Alternatively, use default.el as startup-file, and place it in your lisp directory.

When dumping, make sure that you have enough room on your disk. It should have room for three copies of emacs.ttp during the dump phase. If your dumped emacs won't work, try to execute temacs -l loadup.el, which should give you a working emacs. If this succeeds, odds are that the dump-process didn't go through.

If you get an error saying something like "could not allocate x bytes of rel info", try to use xstrip.ttp that removes the symbol-table. using a -k switch means that the stcksize symbol is retained, so later changes of it is possible.

When dumping, make sure that the relevant .elc are present, since can't dump from .el files that takes up more room from emacs' precious pure storage.

Last, get hold of a copy of the elisp info package. This is close to invaluable when doeing any emacs hacking.

1542. >>>READ THIS - DEATH OF ATARI.ARCHIVE.UMICH.EDU<<<

Newsgroup: comp.sys.atari.st
Date: 1992-02-14 14:53:08 UTC
From: weiner@terminator.cc.umich.edu
Message-ID: <1992Feb14.145308.18004@terminator.cc.umich.edu>
Source record: 225554

Below is a message from our archive admin, Fred Swartz. In it, he
explains that senior itd management has decided to do away with the
archives (including a.a.u.e). We'd like you to send any messages of
support to archive.support@atari.archive.umich.edu. Hopefully,
if we show theose guys how important the archives are to several
people, they'll let us kepp 'em.

Again, two addresses you'll want to know:

archive.support@atari.archive.umich.edu (to add to the support mail) and
all-archivists@atari.archive.umich.edu (to communicate directly with
the mac, msdos, next, econ, linguistics, and atari archive folks)

Thanks,
weiner

To: all-archivists@terminator.cc.umich.edu
Subject: Death of the Archives?
Date: Thu, 13 Feb 92 23:48:01 -0500
From: "Fred Swartz" <swartz@terminator.cc.umich.edu>

While not decided with finality, it looks like the ITD Sr Managers have
decided to cut funding for several major projects in ITD, including the
Archives. It looks like about 30-35 people will be affected. I expect
my position to be cut entirely, but I don't know exactly how this will
affect the 0.25 part of Allan and Mike that RS pays for, perhaps CSS
and CITI will pick it up. I'll let you know when/if I find out.

When I talked to Mike Clark (my manager in Research Systems) about
continuing the archives on volunteer power (as it largely runs right
now), he was very negative on the idea, but failed to supply a
convincing argument for abandoning it. I'm stunned and upset.
The Archives have managed very well on volunteer effort up til now and
it seems to me that something else is going on other than a genuine
concern for serving the users.

I don't know what this means for the Archives, although they aren't
going to be turned off tomorrow. I'll let you know whatever I find out
as soon as I can.

1543. Spectrum 4096 colors?

Newsgroup: comp.sys.atari.st
Date: 1992-02-14 16:49:01 UTC
From: miked@syscon.rn.com
Message-ID: <1992Feb14.164901.14422@syscon.rn.com>
Source record: 225657

In comp.binaries a program was just posted with the following header:

Start with filname as parameter to show Spectrum 512/4096 picture
On MEGA STE it switches to 8 MHz while showing the picture
Install with DOC-type SPC if you want to double.click on SPC files to look at
them...

Lars-Erik / Registered Developer / ABK-BBS +47 2132659 / ____ ______
0sterud / w/ Atari Scandinavia / larserio@ifi.uio.no / /___ /
__________/ _____/ _____/ ____/ /

Is there some sort of patch to make Spectrum support 4096 colors on
the STE or for the JRI4096 board? I thought someone had contacted
Trio and they said it would take a complete rewrite of the program.

Shame you're only referring to North America. In the UK (and most of the rest of Europe), the Amiga is the biggest selling machine.

So we get lots of support. (as does the ST, though not to the same extent. When I owned an ST a couple of years ago, it was the Amiga that was struggling to find support!)

Date: 1992-02-14 17:27:28 UTC
From: cse0071@uoft02.utoledo.edu
Message-ID: <1992Feb14.122728.6158@uoft02.utoledo.edu>
Source record: 225739

I just purchased Calamus (v1.09n, I know this isn't the newest, any info on upgrades to the S series?), I have a Mega2 with a Panasonic 1124 printer. When I went to print the first page of the tutorial document, it must have took 20minutes or more. I'm considering getting a DeskJet 500, will this improve my printing speed or is Calamus just slow because I only have 2 Megs and not 4??

Any help or comments on how Calamus works with DJ500 I would appreciate it, and will Calamus SL use color with the DJ500_C??

Thanx for any help in Advance!

1549. Spectre GCR test: is it the drive or the floppy?

Newsgroup: comp.sys.atari.st
Date: 1992-02-14 21:23:57 UTC
From: rcd@cbnewsj.cb.att.com
Message-ID: <1992Feb14.212357.4753@cbnewsj.cb.att.com>
Source record: 225745
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

The Spectre GCR test always blames the _drive_ if it has a
problem reading (or writing) a track. However, my experience
suggests that my drive is fine, its how the data is written on
the floppy that causes problems.

I know this seems weird, but I can almost fill up my floppy
(say, up to 760K) with a lot of small files, and the GCR test
runs fine. However, if I put one big (say, 680K file) on the
SAME floppy in the SAME drive, I get "The file foo could not be
read, and was skipped" in Mac mode, and a read error in the GCR test!

The problem usually occurs in the inner tracks rather than outer.
I don't think it's a drive or shielding problem, since it happens
on both my external and internal drives.

I work around this problem by running the large file through Compactor
or Stuffit. Has anyone else experienced something similar? Fooling
around with the pot in the GCR didn't make any difference.

Also, is it safe to use floppies formatted and written to on a Mac running
System 7 in Spectre GCR? I got a "This drive needs minor repairs"
message the first time I tried this.

Thanks,

Rana Dutt

1550. ren.lzh (binary)

Newsgroup: comp.sys.atari.st
Date: 1992-02-14 22:30:59 UTC
From: rkallen@msb.com
Message-ID: <1992Feb14.223059.5520@msb.com>
Source record: 225661

I've located a binary here called "ren.lzh" that I believe
is the same program that I'd heard can _rename a directory_ (as well
as renaming files). Can someone confirm this?

Looking at the short docfile, I had the impression that the
program does not truly 'rename' a directory but creates a new one,
moves the files from the source directory to the new one, and then
deletes the old one.

If this program really just can 'rename' a directory, I'd
like to have it. Replies appreciated.

1551. LHARC problem

Newsgroup: comp.sys.atari.st
Date: 1992-02-14 22:33:45 UTC
From: rkallen@msb.com
Message-ID: <1992Feb14.223345.5593@msb.com>
Source record: 225663

Using LHARC (v. 2.01e) from inside FLASH, I couldn't get it to extract individual files from 2 different LZH arcfiles. (Normal, "full" extracts worked ok.)

I kept getting "file not found" prompts, although verbose listings showed that the file was there. Was this a bug in 2.01e that was fixed in later versions?

From: chan@pyramid.cs.unr.edu
Message-ID: <2819@equinox.unr.edu>
Source record: 225651

This is how to envoke the color palette:

when you are in a drawing screen, go down to the bottom of the screen with your pointer (of course, you have to be in draw mode not block mode), and press the right mouse button.

Now you see your color choices, right!?

You can change a color two ways:

Click on the box above the color, go to the RGB numbers and change it according ly. OR DOUBLE CLICK on the color itself (not the box above) quick. You'll either get the NeoChrome colors (array) or CUBE variety depending on what you picked on the preferences on the main screen under, I think, Preferences (on the choices on the upper left side)...

Anyway, hope this enlightens you. Remember: there are a lot of hidden features if you don't know your German (ger2en16.lzh not too helpful)...
For instance the zoom feature (try all of the function keys when you're in drawing mode!

>>of third-party hardware or software if they knew that it was better
>>than an Atari product.

Better check out that honesty crap! They are not friendly at all, especially
that FAT salesperson! (Whatever his name is) I go there to ask about the
ISSAC (spelling) board and that guy quoted me a price of over $2500.00 Geez!!!
I have seen better prices half that! TT is around there at that time!!!
And they don't sell discounted prices!!! They sell you at ATARI RETAIL
prices!!! Lucky when I brought my ST back in '88 I went to the "The
Computer ROOM" which sold the 520STfm for mail order prices while Horizon
stuck to selling their piece for $200.00 more! As of going to sell PCs,
I sold PC's for friends last summer and compare to Horizon, Horizon's prices
were close to twice as much for similar options. ITS NO WONDER WHY that they
are out. I just wonder how they lasted so long. But one thing is for
sure, I am too, disappointed in a ATARI loss.

Is there ATARI mags still available? Is populous II coming out for ST?

Jeff

this is not entirely true. a software company with 5-10 people can make
a decent living (say $100k/employee) in a "niche" market like ST and
amiga, though it might be next to impossible to compete in a "mainstream"
market like MSDOS. few, if any s/w houses start out with 100 or more
employees, even in the 80s when venture capital was relatively easy to
be had. on the other hand, the "big guys" won't bother with the niche
market since there is not enough volume (and they have more overhead,
like corporate lawyers :-). you need a HUGE market to get that sort of
sales productivity out of a large company.

>Atari's and Amiga's will never be well supported.
>Argue as much as you like, but this a cold, hard fact.

no argument, depending on how you define "well supported"...

now can we bury the hatchet forever and get on with better things?

I do apologize. You are right, I was only referring to North America.
Of course the fact that I live in North America tends to affect my
perspective. I do stand by my original statement, however. Add up
all of the number of IBM compatible machines in the world, and then
add up the number of Apple machines in the world. These two numbers
will be much larger than the number of Amigas and Ataris put
together. European developers are doing wonders with the Amiga
and the ST. As an Atari owner I am very thankful that there is
so much quality software for the Atari comming out of Germany.
Europe is perhaps the only hope that Amiga and Atari have of
really picking up a share of the computer market. The sad fact
is that if Commodore and Atari could sell every computer that
they could manufacture, they wouldn't come close to matching
the output of IBM compatible machines. It's a losing proposition.
I'm not saying that it's not a hand worth playing, but clearly
the deck is stacked against them.

I agree with these statements 100%. The problem is that once
the software developers have made a name in the niche market,
they quite often move on to the mainstream market and eventually
quit supporting the niche market. I've certainly seen this happen
with ST developers.

it may be due to frustration more than greed, though. the ST and amiga markets are more susceptible to piracy to the extent that what little market there is is diminished. who wants to see their blood, sweat and tears show up on some pirate BBS for all the world to steal? note that i know there are honest software users, but there are large numbers of not so honest users as well. the best business to be in in these niche markets is hardware. much harder to rip off. you will note that the many of the survivors from way back do hardware, too.

one of the nice things about the TT is VME which makes it possible to expand use of the machine thru interesting hardware. we'll have to wait and see where that takes the machine...

The SM125 is much the same as a SM124, but has a swivle base and
screen hight adjustment, screen looks biger..?? main controls under front
edge..

Well how about this model SC1425 EST monitor, has a 0.31 dot pitch and
seems to have the specs of a VGA monitor, from Atari info Dated 1986.??

Hello!

Yesterday, my friend Volker killed a chip from 'Adaptec' in his 88-Syquest-drive. It seems to be the SCSI-controller, his name is 'AIC-6110 HQ'.

Is there everybody who knows this chip or at least an address of 'Adaptec', in USA or, by chance, in Germany?

Please help us, my friend is very down :-)

Bye, Michael

1571. Using VANTERM to download

Newsgroup: comp.sys.atari.st
Date: 1992-02-15 14:53:19 UTC
From: esf041@cck.coventry.ac.uk
Message-ID: <an6dbrlz@cck.coventry.ac.uk>
Source record: 225660

Can anyone help...?

A Collegue has the P.D. communications package VANTERM for his Atari ST
and wants to use it to download files from a system supporting
Kermit.

Does anyone know if this is possible using VANTERM, as Kermit is not one
of the options listed in the file Xfer menu.

Please EMAIL any replies,

Thanks

1572. Icons -- There doesn't seem to be a way to use them...!

Newsgroup: comp.sys.atari.st
Date: 1992-02-15 23:05:39 UTC
From: mforget@ersys.edmonton.ab.ca
Message-ID: <5Nk8FB1w164w@ersys.edmonton.ab.ca>
Source record: 225668
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Here is a major stumbling block in my programming efforts that I never counted on. The ST provides such useful routines for doing most things, like menus and resource files, but all the information I have completely excludes the subject of icons. Since I have received such wonderful (and extensive) help from this newsgroup before, I decided to ask once again. What I have so far is a group of icons in a .RSC file that I would like to be able to place on the screen. Seems fairly simple, but you'd be surprised. The effect I am looking for is what you see in the GEM Desktop. Icons on the desktop. The reason they are in a resource file is simply because NeoDesk does it that way. A friend of mine took icons drawn by someone else (public domain from atari.archive) and loaded them into the NeoDesk Icon editor. Then he saved and went into the Atari RCS. From there he took the icons out of the NeoDesk resource and placed them in a seperate file. After all, the icons may be public domain, but no part of NeoDesk is. It doesn't matter how I get the icons on the screen, so long as I do.

Second note: Did my friend and I infringe on any copyrights by using the Icons (public domain) that were meant to be used with a commercial product? I hope not. If we did, I could always drw the icons by hand.

Would you be willing to post more about your init package?

I don't have a TT (can't afford it); I've got an ST (original motherboard ... revision A) with 4meg, 120Meg X 10msec HD, and 65Meg X 28msec HD. Would this be enough to comfortably run? (Yes I know, 8MHz is a little slow these days, but I can't afford a $700 accelerator board either, as much as I'd like it.)

If it isn't a real controller chip, how can it read IBM and
atari disks so easily???

It probably isn't possible for the atari to read amiga disks.
The amiga reads and writes disks a track (11 sectors on amiga
disks) at a time.

1578. News about possible cut back on atari archive

Newsgroup: comp.sys.atari.st
Date: 1992-02-16 20:37:22 UTC
From: sytang@lamar.ColoState.EDU
Message-ID: <1992Feb16.203722.17950@yuma.acns.colostate.edu>
Source record: 225673

Below is a copy of message that was posted in comp.sys.mac.announce, although
it was addressed to Mac user on the possible closure of mac.archive.umich.edu
it also mentioned other archive currently at umich.edu.(sounds like they are
thinking of stop the support for microcomputers archives which includes atari
archives). Don't panic yet, as the message state, it's not offically decided
to close them. They do represent a possible closure, and the original poster
is asking for idea and suggestions in how to change the situation.
So here we go.
Tang
sytang@lamar.colostate.edu
P.S. Don't reply to me, use the address given in the message below, or discuss
in the newsgroup.
********* original message from comp.sys.mac.announces *****************

[Oh dear, oh dear.... and I may have to trim back or shut down
the RASCAL archives due to priorities... and SUMEX only still
exists based on sheer (volunteer) will-power of some old-timers
who do not want to see it die; and SIMTEL20 has not been
updated since October, and the (volunteer) Richard Thum
<rthum@WSMR-SIMTEL20.ARMY.MIL> just returned home from the
hospital after major surgery, and SIMTEL20 may have to be
shut down completely for other reasons ... Unless there
is some serious funding and research interest to support
net-wide FTPable sites, I fear that TANSTAAFL will become
the rule here also ... ---Werner, csma-moderator]

Dear mac-archive-user....

I have some very very disturbing and shocking (at least for me) news
to relay to you....

Due to budget constraints at the U-M Information Technology Division,
a tenative decision has been made to cut and cease support of the largely
volunteer archive service (i.e. mac.archive.umich.edu, msdos.archive.umich.edu,
next.archive.umich.edu, linguistics.archive, atari, etc.).

Here is a copy of the message I received about a half hour ago
>From my supervisor on the project:

Message-Id: <9202140448.AA08771@terminator.cc.umich.edu>
To: all-archivists@terminator.cc.umich.edu
Subject: Death of the Archives?
Date: Thu, 13 Feb 92 23:48:01 -0500
From: "Fred Swartz" <swartz@terminator.cc.umich.edu>

... ...I don't know exactly how this will
affect the 0.25 part of Allan and Mike that RS pays for, perhaps CSS
and CITI will pick it up. I'll let you know when/if I find out.

When I talked to Mike Clark (my manager in Research Systems) about
continuing the archives on volunteer power (as it largely runs right
now), he was very negative on the idea, but failed to supply a
convincing argument for abandoning it. I'm stunned and upset.
The Archives have managed very well on volunteer effort up til now and
it seems to me that something else is going on other than a genuine
concern for serving the users.

I don't know what this means for the Archives, although they aren't
going to be turned off tomorrow. I'll let you know whatever I find out
as soon as I can.

-- Fred

I talked on the phone with Fred and we both agree that this decision
seems very unfair to both the students/faculty who use the archives
here at the University of Michigan, and you... the users on the
Internet, Bitnet, UUCP, etc.

To me, it doesn't make much sense to cut off support for the archives.
Both I and Allan make around $70 a week working on the archives (I work
on the Mac side, he works on the msdos side).. the rest of the time
we spend is voluntary, like the twenty or so other people who add/keep
up the archives here. The archives are probably one of the most popular
and beneficial services that ITD offers. There may be other ways to trim
the budget, but cutting off something that costs nearly nothing
to begin with doesn't seem very wise.

Please help us out. E-mail in support of our archives can be sent
to archive.support@mac.archive.umich.edu. We don't want to flood the
senior managers' mailboxes, and we're still thinking about what we
can do to save our archives. Comments can be sent
to us at "comments@mac.archive.umich.edu". To address the entire
archive group, you may send e-mail to "all-archivists@terminator.cc.umich.edu".

Thanks....

mike@mac.archive.umich.edu

p.s. I apologize because I've posted this to so many newsgroups.. I wanted
you to at least be aware of what's going on over here and ask for you to
help.

>so you can try others - gcc has a bunch of options besides "-O").
>try inlining. this will make whetstone run 2x faster on some boxes.

Whetstone was constructed after collecting statistics from many Algol programs. It has procedure calls in it to match the statistical distribution of procedure calls found in those Algol programs.

If you make the compiler inline the procedures then you're not doing Whetstone any more. Procedure call overhead is part of the benchmark.

Also, you should not do _any_ source level optimisations on benchmarks -- it's the same as cutting out part of the benchmark code.

The idea isn't to get from A to B as fast as possible. It's to make a comparison between machines based on performing the same operations on each machine.

>report the dhrystone version. v1 give numbers about 2x higher than
>v2.0 or v2.1, for example. when giving bm results, it is better to say
>more than less.

Unfortunately, Dhrystone performance basically boils down to how fast your system can do string operations. Dhrystone V1 has bugs in it too. Finally, when giving benchmark results, it is better to do it well and report honestly.

>finally, if possible, try sozobon as well, with

.dcm files are 8-bit Atari disk images created with Bob Puff's
Disk Communicator. Obviously, they were uploaded to the wrong directory;
they ought to be moved to the /8bit directory.

1583. Keyboard Woes.

Newsgroup: comp.sys.atari.st
Date: 1992-02-17 02:04:09 UTC
From: elvis@watnxt1.ucr.edu
Message-ID: <20203@ucrmath.ucr.edu>
Source record: 225678

Hi,
My St has been acting oddly for a little while, and now that our news-reader seems to be working again, I was wondering if anyone could help me with the problem. It seems that occasionally my keys get stuck in auto-repeat. The most common key for it to happen to is the ALT key. However, before someone says 'sticky keys', I think that there is more to it than this. I'm using Z-keys, and it only does it with the IBM keyboard, not the built in one, but has done it with more than one IBM keyboard. It also slows down if I set the auto repeat rate down on the control panel. Usually (at least with ALT and Control) it turns itself off if I hit the key again. It seems worse under Neodesk, where I can't even hold down shift and click on several files (to move them, or whatever), without things going hay-wire. Normally what happens then is that after selecting one or two icons, the mouse starts moving randomly and then it switches the cursor to a bee, like its accessing the drive. Then it might select the drive D: icon, might scroll the window down, or the mouse might start sinking to the bottom of the screen. The last seems to have to do with the computer thinking that the alt and down arrow key are on. If I hit the alt key, the system seems to realize that its not being held down, and stop dropping the cursor. Anyways, all this is making using my ST somewhat of a living hell, especially when I'm in the editor and delete key goes into overdrive. Could this be a virus? I haven't heard of any like this, but does anyone know of a good virus scanning program for hard drives? Or does a kindly hardware Guru have an idea what's going on?

Thanks,
Andrew (watkins@ucrvms.ucr.edu -or- elvis@watnxt2.ucr.edu)

p.s. Any Z-keys experts out there? To get the keyboard I am currently using to work, I have to set it to work for an AT when I power up the computer, then switch it over to XT. It seems that in XT mode it doesn't draw enough power to get itself going. (I checked, when set to an AT it draws more power)

The various items listed here are for sale. If you are interested in anything here, please contact me via:

GEnie: C.FREEMESSER
Internet: clf3678@ultb.rit.edu
clf3678@ritvax
Phone: (716)328-5505 after 6pm EST

Prices do not include shipping. Will make a deal on multiple purchase of items, but prices are pretty low. Everything listed here is in PERFECT working condition! I'll find out the EXACT UPS shipping charges for anything you want to order.

Amiga 500 computer system. About 4 months old. Includes the computer with a 1MB Supra memory expansion (total memory 1MB). This was one of those starter kits that came with the Amiga 520 RF/color composite adapter, TextCraft Plus, Tetris, and Where In the World is Carmen Sandiego. Complete with all manuals, disks, original packaging, cables, etc. I will throw in a copy of "Amiga for Beginners" by Abacus Books, a few European mags, and Gauntlet II. I'll also include the original reciept for everything so you can take advantage of the remaining warranty period.

$300

Maxtor 7120SR hard drive. 130MB 3.5 inch low profile drive mechanism. Transfer rate of 960K/s @ 23ms. Low power, quiet mechanism. Manufacture date of Sept 29, 1991. This is one NICE drive! I used it for about 6 weeks on my BBS, which I have since taken down. Now I need the money more than the drive. :^(I will include the original receipt so you can take advantage of the remaining warranty. Drive was bought in November.

$325

Zenith Data Systems 2400 baud modem. Only used a few hours. This is a "standard" modem, with Hayes compatibility and a size that fits easily under a telephone. Has the standard 8 LEDs on the front, with power switch on back. Includes manual.

$65

Amiga Software (all include boxes and manuals):

Alternate Reality: The City.....$10
TransWrite (latest version).....$40
Wings.....$30
Battle of Britain (LucasFilm)....$15
FirePower.....$10

Atari ST Software (all include boxes and manuals):

Great Battles (Napoleonic/Civil War).....$10
King of Chicago (Cinemaware).....$10
BattleHawks: 1942.....$15
Sub Battle Simulator.....$10
Hole-In-One Mini Golf (2nd disk bad).....$2

>Has anyone ever compiled Rayshade for the ST? I got a hold of the sources
>but don't have the resources to compile it.
>
>Thanks

I've not done it for the St, but I have for the TT.. (GCC 1.40 + mintlibs +
pml(68881 option)).

The best way of compiling it is to first configure it on a Unix machine,
archive the directory structure using something like tar (with GNU tar on
the ST) and copy it onto your ST.

As the ST's libs with GCC are BSD-like and the Unix machine is hopefully
also BSD based, the compilation will only need a few tweeks here and there.

Please note.. on the ST floating point operations have to be done in
software, so Rayshade will run VERY slowly.. something like 1/300th the speed
of a Sun SPARCstation IPX, or about 1/100th the speed of a TT!

Oh yes.. if possible, keep 32bit ints... Rayshade was designed for Unix
machines, all of which have 32bit int compilers.

Sorry I didn't give much info on the switches used! Actually I only used -O with GNU-C. I didn't use other switches because I only wanted to test the performance the way programs are compiled usually. Besides, this was just a quick compile-and-run...

>try inlining. this will make whetstone run 2x faster on some boxes.

>a 4:1 difference on the same box. caveat user. compile times may also
>be of interest to round out the report.
>

Actually, I didn't post these results to compare GNU-C with Turbo C or whatever, I just wanted to give results for the two most commonly used compilers on the ST (which I own,too!). I know how slow the Alcyon compiler is, in fact some time ago I got an already compiled benchmark program (the same!) which after being disassembled revealed a really strange programming style (e.g. move.l #routine,a0 / jsr (a0) to call a subroutine or something like that) which was the obvious reason it only gave me 800 dhrystones/sec.!! This was the main reason, I have to admit that I posted these results....

>thanx for this info, tho...
>

I guess I'll have to do some more tests to straighten this out! :)

>what are they for?

You need to give a list of icons to browse; thus browse /usr/local/mgr/icon/*
on my system gets me lots of piccies! Font is a bit trickier, you need to
set up a mgr.rc file in your HOME directory with a list of fonts, and then use
a number to select the one you want.

Message-ID: <1992Feb17.115900.29120@aber.ac.uk>
Source record: 225689

I saw the SM144 just this weekend at a comp show and I have to say (and so were a number of other people including dealers) that its a step down from the SM124. If you can buy a SM124 then go for it because they are in general cheaper and of much better screen quality than the SM144. They've made the SM144 larger screen (14") and the phosphor is not as paper white as the SM124, it has a blueness about it which I didn't like. Some poeple are bound to like though.

1591. PCB Software?

Newsgroup: comp.sys.atari.st
Date: 1992-02-17 12:28:33 UTC
From: silvera@p4.cs.man.ac.uk
Message-ID: <silvera.698329713@p4.cs.man.ac.uk>
Source record: 225563

Are there any professional or public domain programs for the ST
that can be used in the design of PCB's? I am looking for software
which might be able to take a circuit diagram and design a PCB layout
with autorouting and output it to a range of printers so it can
directly used for making the board.

I have never seen a PCB layout program, although I have seen many
circuit diagram drawers.

Cheers.

>The problem usually occurs in the inner tracks rather than outer.
>I don't think it's a drive or shielding problem, since it happens
>on both my external and internal drives.

This is exactly what happens with a dirve shielding problem, or a "cheap disk" problem (use high-quality disks), OR a GCR problem. Since you've tried adjusting the GCR, it must be one of the other two problems. I don't know if you are using a Mega, but the easist way to shield the drive, is to open up the box, wrap the drive data cables in aluminum foil, and then wrap the aluminum foil in some type of tape, to avoid any possibility of shorting against something on the motherboard. This worked great for me. I would also suggest purchasing the best disks you can get ahold of (try FUJI).

DISCLAMER: My cat typed this, not myself... No, wait, seriously, don't do this unless you feel confident you won't screw things up. If you screw things up, it is your fault because I never actually touched your machine so it can't be my fault. Got it?

Hope this helps (can we add this to a FAQ list somewhere, please?)

I don't know if my problem is related but recently I attempted to write 105 files to a floppy - after ejecting the disk and re-inserting it I got a message that went something like "finder doesn't have enough memory to read this disk". I also noticed this problem on a disk with 82 files on it. Does Spectre disks have some sort of file number limit??

1595. Death of the Archives...PLEASE READ

Newsgroup: comp.sys.atari.st
Date: 1992-02-17 16:19:11 UTC
From: sjg@terminator.cc.umich.edu
Message-ID: <1992Feb17.161911.14621@terminator.cc.umich.edu>
Source record: 225481
Cross-posted to: comp.sys.atari.st.tech,comp.sys.atari.st

I am posting the following email with permission from the author.
It talks specifically to the users of the mac archives here at
U of M but it also applies to those of us who utilize the atari
archives as well.

_____
Dear mac-archive-user....

I have some very very disturbing and shocking (at least for me) news
to relay to you....

Due to budget constraints at the U-M Information Technology Division,
a tenative decision has been made to cut and cease support of the largely
volunteer archive service (i.e. mac.archive.umich.edu,
msdos.archive.umich.edu,
next.archive.umich.edu, linguistics.archive, atari, etc.).

Here is a copy of the message I received about a half hour ago
from my supervisor on the project:

Message-Id: <9202140448.AA08771@terminator.cc.umich.edu>
To: all-archivists@terminator.cc.umich.edu
Subject: Death of the Archives?
Date: Thu, 13 Feb 92 23:48:01 -0500
From: "Fred Swartz" <swartz@terminator.cc.umich.edu>

... ...I don't know exactly how this will
affect the 0.25 part of Allan and Mike that RS pays for, perhaps CSS
and CITI will pick it up. I'll let you know when/if I find out.

When I talked to Mike Clark (my manager in Research Systems) about
continuing the archives on volunteer power (as it largely runs right
now), he was very negative on the idea, but failed to supply a
convincing argument for abandoning it. I'm stunned and upset.
The Archives have managed very well on volunteer effort up til now and
it seems to me that something else is going on other than a genuine
concern for serving the users.

I don't know what this means for the Archives, although they aren't
going to be turned off tomorrow. I'll let you know whatever I find out
as soon as I can.

-- Fred

I talked on the phone with Fred and we both agree that this decision seems very unfair to both the students/faculty who use the archives here at the University of Michigan, and you... the users on the Internet, Bitnet, UUCP, etc.

To me, it doesn't make much sense to cut off support for the archives. Both I and Allan make around $70 a week working on the archives (I work on the Mac side, he works on the msdos side).. the rest of the time we spend is voluntary, like the twenty or so other people who add/keep up the archives here. The archives are probably one of the most popular and beneficial services that ITD offers. There may be other ways to trim the budget, but cutting off something that costs nearly nothing to begin with doesn't seem very wise.

Please help us out. E-mail in support of our archives can be sent to archive.support@mac.archive.umich.edu. We don't want to flood the senior managers' mailboxes, and we're still thinking about what we can do to save our archives. Comments can be sent to us at "comments@mac.archive.umich.edu". To address the entire archive group, you may send e-mail to -"all-archivists@terminator.cc.umich.edu".

Thanks....

mike@mac.archive.umich.edu

---

as of now, I am unsure whether we have corresponding groups set up for our side of things, but you can certainly send your support to all-archivists@terminator.cc.umich.edu

thanks,

Susan

This is not a Spectre problem but a Mac bug. You should only get this error while using "Multifinder", and when copying large numbers of files. The "Finder" then counts as a seperate program with "X" amount of memory. The Mac OS dies when you try to copy too many files because it keeps the directory of each in memory (I think this is why it dies, but this is second-hand info, and therefore subject to great error, possibly), ever notice how the mac reads the files without going back to the directory tracks of the disk each time? A way around this is to open the system folder, and select the "Finder" icon. Pull down "get info" from whichever menu it is under, and then edit the amount of RAM the Finder will get when using multifinder. The box to edit this is in the lower right hand side of the dialog box. It is usually set to 160, but setting it up to 200 can help. I think I keep mine at about 320 most of the time. Remember that the more memory you give the finder, the rest you will have for your other programs. Hopefully this bug will someday be fixed...

Hope this helps...

By the way, you really should read my cool .sig file ;-)

1597. Re: why do I only get 512k on a 1040

Newsgroup: comp.sys.atari.st
Date: 1992-02-17 16:53:36 UTC
From: woodcock@utdallas.edu
Message-ID: <1992Feb17.165336.11127@utdallas.edu>
Source record: 225693

A friend of mine has an 1040 st that only show 512k out
of 1040k when he runs the ram test. Any ideas, other
than the possibility of having bad ram chips ?

What probably happened is some unscrupulous scumbag bought a 1040 and
a 520 and swapped the covers and returned the 1040 (which is really
just a 1040 cover with a 520's guts). Happens all the time.

>>Internet:- ucacmsu@ucl.ac.uk or susher@csm.ac.uk

I've had a number of enquiries about this package, here are the specs and what is probably needed to run it:-

init
login
getty
passwd
who
finger
ac

All of the above programs (except finger) were written from scratch using the SunOS 4.1 manual pages as a reference guide. Getty and ac were written by Dave Gymer, the rest (except finger) were written by myself.

Finger was a public domain version by A.N.Other.

I'm sorry if this seems sporadic.. I can't see what I'm typing as the machine I'm writing it on is taking about 20 seconds per character.

Thwhole package (including binaries and source) takes about 600K, so it doesn't take up too much disk space.

What do you need to run it?

Well it runs fine on my 2.5MByte 520STM (TOS 1.4) as long as I don't start any daemons.
I can't really go into any more detail as this machine is being a pain.

By the way.. there isn't a full set of documentation yet, and it's not yet on any archives as it is still in Beta test.. but I could get it put on a.a if people want.

Steve

I'm pretty sure they're Diskcommed for the Atari 8-bit computers.
(Similar to .msa) I don't know how they ended up in the ST section
though.

>on it. Does Spectre disks have some sort of file number limit??
>
>Bob Malay

Nope, it's likely be your Mac set-up.
1. How many windows are opened when this happen? If you have too many and/or
each with a lot of files in it, the finder is using all the system heaps for
it so it give that warning.
It's not the problem of Spectre, on real Mac you'll get that message as well.

2. To solve it, close down unused window.
If can't reduce the number of window, then get a file called heap tool from
Mac archive or PD library. It will allow you to increase the system heap size
.

Hope these help.

STACE [RT SysOp] at 23:29 EST

SST BENCHMARK COMPARISONS

Note: This posting may only be reproduced in its entirety and only if proper credit is given to the Gadgets by Small RoundTable on GEnie. Thank you!

ABOUT THESE TESTS:

* I refer the reader to the documentation for QUICK INDEX 2.2 and NBM 1.2 for more information about those programs.

* All of the "REAL WORLD" Benchmark results were timed using a stopwatch. Each test was conducted three times and then the results were averaged. All times are in minutes:seconds.hundredths of a second (MM:SS.xx).

About the "REAL WORLD" tests:
* WORD WRITER SEARCH & REPLACE - Time it took to search for the word "the" and replace it with the word "test". The document used was 186K in size.
* WORD WRITER SCROLL - Time it took to scroll (using the GEM window scroll arrow) from the beginning to the end of a 60K document.
* AVANT VECTOR AUTO-TRACE - Time taken to auto-trace a .IMG file. The file used was a 6K image of a pair of theater tickets. Demo version 1.2 of Avant Vector was used.
* DYNACADD 3D-CUP DEMO - Time it took to finish plotting the 3D-CUP demo supplied to me by ICD. Demo version 2.0 of DynaCADD was used.
* DYNACADD TT - Time for the TT version of DynaCADD
* DYNACADD ST - Time for the ST version of DynaCADD

ABOUT THE COMPUTERS:

* All computers were tested with QUICK STE 3.0 loaded (loaded into fastram on the SST). Except for the fastram initialization software used with Gadget's SST, no other software was loaded on any of the computers.

* All computers were tested using Atari's SM124 monochrome monitor.

COMPUTER CONFIGURATIONS:
* 8MHZ ST = Mega 4 ST, TOS 1.4, Blitter on
* ADSPEED ST = Mega 4 ST, AdSpeed ST 16mhz accelerator, TOS 1.4, Blitter on

* TURBO 25 = Mega 4 ST, Turbo 25 25mhz accelerator, TOS 1.4, Blitter off,
JRI 68881 math chip board
(Note: The blitter in this particular Mega was not compatible
with Turbo 25.)
* SST 20MHZ = Mega 4 ST, SST/68030 accelerator running at 20mhz, TOS 2.06,
Blitter off, 4 megs of 60ns fastram initialized at 1 normal
and 1 burst mode wait state, 68882 math chip running at 20mhz
* SST 33MHZ = Mega 4 ST, SST/68030 accelerator running at 33mhz, TOS 2.06,
Blitter off, 4 megs of 60ns fastram initialized at 2 normal
and 1 burst mode wait state, 68882 math chip running at 33mhz
* SST 40MHZ = Mega 4 ST, SST/68030 accelerator running at 40mhz, TOS 2.06,
Blitter off, 4 megs of 60ns fastram initialized at 2 normal
and 1 burst mode wait state, 68882 math chip running at 40mhz

THE TEST RESULTS:

8MHZ ADSPEED TURBO SST SST SST
QUICK INDEX 2.2 ST ST 25 20MHZ 33MHZ 40MHZ
--- --- --- --- --- --- ---
CPU Memory 100% 164% 230% 598% 989% 1189%
CPU Register 100% 204% 319% 512% 843% 1024%
CPU Divide 100% 203% 319% 638% 1056% 1268%
CPU Shifts 100% 207% 324% 2181% 3661% 4457%
TOS Text 344% 529% 762% 620% 887% 942%
TOS String 1433% 2127% 2929% 3062% 5318% 5614%
TOS Scroll 138% 142% 149% 157% 158% 158%
GEM Dialog 317% 490% 605% 556% 683% 709%

Note: All Quick Index figures are as compared to a 8mhz TOS 1.4 ST.

NBM 1.2

Math Routines 16.53 9.11 6.41 4.58 2.89 2.40
Memory Fetch/Store 16.21 10.49 8.85 4.15 2.62 2.17
Dialog Box Draw 14.81 9.81 8.63 8.88 7.48 7.19
Graphics 68.01 36.51 25.68 22.16 15.79 13.24

"REAL WORLD" TESTS

Word Writer
Search & Replace 1:39.64 1:18.18 1:00.80 43.64 31.73 28.89

Word Writer Scroll 1:05.64 45.85 47.30 35.66 26.88 25.17

Avant Vector
Auto-Trace 7:26.15 4:09.42 3:02.46 2:15.96 1:28.70 1:15.18

DynaCADD 3D-Cup
DynaCADD TT N/A N/A N/A 1:08.09 43.90 37.29
DynaCADD ST 23:29.18 12:35.93 2:54.24 2:10.54 1:24.51 1:10.97

Note: The DynaCADD figures for T25 and SST really show how much a math chip
improves performance. Further, the DynaCADD TT figures show the

performance gain experienced using a version compiled specifically
for the 68030.

From the very beginning it was my intent to include the figures for a
Atari TT with fastram for comparison purposes. Unfortunately, I was not
able to do this. In the future, when a TT with fastram becomes available
to me, I will post the figures for the TT.

Mark

Could you make the data files WW and AV for testing by others?

Thanks for posting the benchmarks Mark.

Category 9, Topic 5
Message 34 Thu Feb 13, 1992
DAVESMALL [Dave] at 01:40 EST

Mark, that is a really fine job. THANK YOU!!

Some of those numbers are astonishing to me -- and I been using this thing for
months! Wow, is Codehead going to be happy!

One question: Was there disk I/O during the tests that don't specifically have
"disk" on them, like in word processor tests? I assume not, but am curious.

Thanks again, Mark!

(People, running and rerunning and rerunning programs like this is a KILLER
... changing CPU's, etc. Mark really worked at this; I know, having generated
tables like it.)

-- thanks, Dave / Gadgets

p.s. I have a version of MAGPLOT that plots 20 known points, but do not yet
have 200 hz ticker code in it to time plots. That'll show FPU performance in a
big way.

Category 9, Topic 5
Message 35 Thu Feb 13, 1992
STACE [RT SysOp] at 18:21 EST

Jim,

The 60K file used in Word Writer for the GEM Scroll is the documentation file
for Pinhead version 2.1.

The .IMG file for the Avant Vector auto-trace test is called TICKETS and I am
99% certain that it can be found in the ST RT. I'll check and post a file
number.

Unfortunately, the 186K file I used for the search and replace is a proprietary file that I cannot let out. Truth be known, it is first draft of the SST manual. I wasn't trying to be sneaky or anything like that by using this file I was simply looking for the largest file I could find. Since I already had it on my HD it was perfect. I will be more than happy to agree on some other readily available text file for a future comparison test. Let me know.

And, of course, you already have the DynaCADD 3D-Cup thingie.

Dave,

The times for all of the tests do NOT include any disk I/O of any kind. The files were all already loaded into memory when the tests began.

Mark

P.S. You are correct. All told I spent something like 10-15 hours testing and re-testing, running around, etc..etc. Still, it was fun! :-)

I would like everyone to pay attanetion to the excellent # crunching performance Mr. Small's board puts out. At 40Mhz its a VERY good bargain.

I'm fairly impressed with the results. CONSIDERING:

a) You can buy the basic board for 599, stripped down, and build as you go along.

b) The board is TRULY clock independant. You wanna go faster? Simply buy a 20, 32, 40, 50Mhz clock crystal and CPU. THATS ALL, not another computer, and NO soldering. Quite excellent.

c) Dave is suppose to have outdone his Spectre 3.0 manual by a couple of magnitudes....REALLY well done documentation, of course.
Way to go Dave.

d) All in all, it seems like the wait was worth it.

-Greg

Christ, thats wonderful. If Atari would spend less money on corporate lawyers, and more on making machines everyone wants, we wouldn't need people like Dave Small to fix thier junk they make.

Atari Sucks, down with Atari.

(Had to get that in thier)

comp.sys.atari.die.die.die.die.die.

1615. What is the keyboard on Mega STe's like?

Newsgroup: comp.sys.atari.st
Date: 1992-02-18 09:14:33 UTC
From: ach-a@minster.york.ac.uk
Message-ID: <698404472.11195@minster.york.ac.uk>
Source record: 225580
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

What is the keyboard on the Mega STe like? Is it the same as the keyboard on the ST because I personally dislike this keyboard. Too spongy in my honest opinion.

How easy is it to change the keyboard to one that I like should I end up upgrading my 1985 ST (Tos 1.0, single sided drive {originally)) to a Mega2, and the keyboard is the spongy one!?

Just for comparison, at university I am using a Silicon Graphics' Iris Indigo workstation and its keyboard is the best I've ever used. The newer IBM ones are a bit clicky and the SUN keyboards are okay.

-Andrew

P.S.
When is Populous II going to be in the shops for the ST?

Ok, I'm not a history major nor a lawyer but here's my explanation of anti-trust violations, let's take it one step at a time :

Trust = organization of firms (businesses) in a particular market (for example, the video game market) set up to control said market by reducing competition. This essentially can be equated with the term : MONOPOLY
Anti-trust legislation (I believe it is the Sherman Anti-Trust act, and possibly other stuff) = Safeguards/laws set up to prevent the development and operation of trusts, notably around the turn of the century when monopolies/trusts were a major problem in many American markets. The purpose of this legislation then would be to ensure the free market we all know and love and protect the consumers from monopolistic actions (i.e. price hikes without limit).

SO, in saying that Nintendo has made an anti-trust violation, they are saying that somewhere along the line they have done something prohibited by the above legislation, i.e. they have monopolized the market or possibly something more trivial, I'm sure the legislation is full of minor stuff which might indicate a trust. :)

Ok, sorry for the long-winded explanation, I think that is the basic idea of anti-trust stuff though... In response to some comment about lawsuits in general, I must say that unfortunately (well not if you're a lawyer I suppose) these are pretty common in computer industries, at least in part due to the fact that we are still working out just what is legal/illegal when it comes to computer programming, hacking, hardware copies, etc (although this particular case seems to be more of a business issue.) Just think of how many times Apple/Microsoft/DRI have battled it out over this windows thing, perhaps IBM is safest just to open up their machines, but who knows they probably find other things to sue about. Well there I go again spewing off, this is more a discussion for alt.business.ethics or somesuch, but there you have it.

Ben Gilbert (tymbrimi@u.washington.edu)
And I still don't have a .sig file, tragedy strikes!

P.S. - The SST stuff I have heard sounds really cool, mzybe by the time I can afford a new computer (try years from now... :(), Dave will have a SSTe out, but by then I suppose Atari will have new stuff too, cool... As long as my 520 doesn't implode I'm ok.. And to the Amiga guys, how's it going, nice to see you're still checking in. I can't see where such malicious / pessimistic comments will get you in the world, but hey, it's a free country and you've got a right to an opinion. Long live Atari and Commodore, no one likes a stranded computer user. (oops I'm preaching again, must be my Picard imitation)...

1618. MEGA-LEIF-CONVENTION

Newsgroup: comp.sys.atari.st
Date: 1992-02-18 11:28:45 UTC
From: m91der@tdb.uu.se
Message-ID: <1992Feb18.112845.20148@tdb.uu.se>
Source record: 225567

```
--------------------------------------------------
-* Official invitation to the MEGA-LEIF-CONVENTION *-
--------------------------------------------------

This is the official invitation to the enormous and already famous
MEGA-LEIF-CONVENTION. This is an international Atari and PC (other
computers are also welcome) demo-convention held by Electra in
Fyrisskolan/Uppsala/Sweden. It begins at 18:00 (local swedish time)
on Thursday the 16th of April, and lasts until 15:00 on Monday the
20th of April.

In the basement of the school we have an old Physical-activities
hall that'll serve as a silent sleeping room. You'll also find free
showers in the same area. At about 5 minutes walk from the school you'll
find the famous Fyrishov recreation centre, so bring your bathing
clothes! At about 10 minutes walk in another direction you'll find the
centre of Uppsala with resurants, shops and Macdonald's.

There will of course be loads of competitions too, that's the reason
we hired an RGB projector! And what will we do with the RGB projector
before the compos? We`ll show movies and demos on it of course! The
competitions (held by us and TOS Magazine) are:

* best demo (1 Meg STE)
* best picture
* best music (modules and blip-blop)
* othello/reversi tournament (your program will play against the others,
you'll get the exact rules at the party)
* best PC demo

Prices in the different competitions:

* first price in the Atari demo competition will be an Atari TT
* in the PC competition we'll throw 2000 SEK (333 USD) at the winner
* prices in the other competitions will be Quantum harddisks,
a high speed modem, an Amiga, an Atari and a colour monitor.

At the party we'll sell coke and you'll be able to order pizzas
at special reduced prices. You'll also be able to buy other computer-
related items (SIMMs and empty disks for example) on the party

The following Atari crews has already decided to attend:
Electra Omega
The Carebears ULM
The Respectables Electronic Images
Sync TEX
Legacy Mystic
```

The Blackcats Scum of the Earth
Alcoholica Delta Force
Synergy The Lost Boys
Unit 17 EPA
The Syndicate Lazer

PC-Crews: Cascada The Codeblasters
The Space Pigs

This is absolutely not a complete list, we get new answers all
the time. If there are enough good screens we'll compile a party-demo.
Also every good group must bring a lame demo for the ultimate lame
demo. People from outside Sweden can hire a monitor for about 150 SEK
(25 USD). The admission to the convention is 90 SEK (15 USD), for girls
it's free.

How do I get to the convention?
If you come by plane to Arlanda (big airport outside Stockholm) we'll
try to fetch you there. If you arrive at Arlanda at such a bad time
that we can't pick you up you could take bus number 801 to Uppsala
central station or a taxi directly to the school (Fyrisskolan, Uppsala).
Please remember that taxi is VERY expensive in Sweden. If you come by
train you will arrive at Uppsala central station. If you have lots of
luggage we'll try to pick you up. However, if you feel like you could
take a bus then try bus number 9, 12 or 13. They all pass the school.
You could also take a taxi, but it's expensive. If you come by car
please contact us and we will send a map.

Please contact us ASAP and let us know how many monitors you want, if
you want to be fetched and where you want to be fetched.

Call Jesper: int+46 18 463347
or Erik : int+46 18 246777.

Or send a E-mail to: t90_jesper@maja.teknikum.uu.se
or: m91jru@tdb.uu.se

Or ordinary mail to: Jesper Rudberg
Flogstav. 63e
752 63 Uppsala
Sweden

You could also contact me (Daniel Eriksson) on any of the below
mentioned addresses. I'm not a member of Electra, but since there
has been some trouble posting to Usenet from our site lately (due
to bad installation of tin) I posted the above text for Jesper.
If you want to arrange your arrival or reserve a monitor you SHOULD
contact Jesper or Erik.

What's the exchange rate like to the UK from the US?

for me to buy something from the UK, it's about 3.2 times the price
shown, to buy from the US it's about 1.8 times the price.

Quite a huge difference, so it's a pitty that we don't see many US]
magazines over here for the atari. I've got an atari interface
here, but it is a bit lacking in mail order companies compared to
the English ones :-(

>> Atari is suing Nintendo for $160 mil for Antitrust violations. If they win,
>> judgement is tripled.

>What exactly is meant by anti-trust violations?

My understanding of the case is that Nintendo, as a price for allowing
game developers to develope games for the Nintendo system, exacted
a promise that the developer not develop for the Atari (or Sega,
or other competitors). This is akin to forcing a person developing
a piece of software for the Mac only no be able to sell it for the Mac,
not the IBM PC. By at least some interpretations (Atari's clearly
included), this could be called restraint of trade.

Ok I'm gonna be getting a new computer so I want to sell my ol St her at
home

Heres the stats.

Atari 520 STFM with internal DS/DD Drive and 1 Meg upgrade (note:
not a piggy back upgrade)
14 inch color monitor
sx212 1200 baud modem
external SS/DD drive.
Supra 30 meg hard drive SCSI compatiable.

and about 300 disks of games- not public domain games but real
games like Dragons Lair, Space Ace, The Killing Game Show, Breach
2
If someone is interested I'll List all of the games that I have
they all do come with Docs.

I'm asking $800.00 dollars for the whole system.
Note : I will not seperate the parts to sell separately. It
either all goes or not at all.

You can send any replys to. :-)

1629. SM147 Review

Newsgroup: comp.sys.atari.st
Date: 1992-02-18 16:02:54 UTC
From: malay@sae.com
Message-ID: <1992Feb18.160254.20272@sae.com>
Source record: 225571

The other day UPS delivered a white box with no Atari labels, no fuji symbol - nothing that hinted that this was a Atari product. Opening up the box revealed a 14" Super VGA Monochrome monitor. The documentation that came with the monitor also lacks any Atari corporate stamps. The monitor is a 14" flat screen paper white display. The front panel contains the lighted on/off push button switch, brightness control, and contrast control, oh, and to the left of the controls is a name plate with "Atari" on it - no fuji. The back of the monitor has user-accessible vertical size, horizontal phase (position), sub brightness, and focus. The monitor sits on a tilt and swivel base. The color of the plastic is a much deeper gray color than any of the "normal" Atari products. The size of the unit is taller than the SM124, but not as wide or as deep.
So I hooked this thing up and booted, the display is very bright and white (not bluish as was described by someone else on this net when they mentioned the SM144). There is no sound, but thats ok I use the external speaker outputs on the STE anyway. The picture quality is sharp and precise, and I especially like the ability to adjust the picture size whenever I want to without resorting to surgery. At first I noticed some shadowing going on, but tracked that down to my monitor switchbox - which I repositioned and all the shadows disappeared. This display does have one defect - the top portion of the screen seems as if it is being "pulled" down - horizontal lines appear to be downward arcs - I hope this is just a minor adjustment - does anybody have any ideas about this??
At first I was a bit disappointed, I guess I expected something on the order of a Sun Mono monitor :) - after using it for awhile, the larger screen just makes things easier to see - I find myself squinting less. All in all I like it - and the Spectre GCR Mac screens look great (I did have to downsize the screen to make the Mac desktop look normal and not stretched horizontally).
Bargain hunters take note - I would bet that you could pick up a the PC version of this monitor, cut of the D-Type connector and add the Atari monitor cable - it appears thats what the manufacturer has done.

Well I hope Atari wins! If Atari's marketing or lack of marketing is bad then Nintendo's is at the other end of the spectrum - they sell ho-hum game systems as if they were the hottest stuff on the market. They soaked the NES market (particularly the US) for all it was worth prior to releasing the SNES to the US market even though it was available in Japan almost a year in advance of its US release.

Down with Nintendo! Gameboy Sucks!

Hi,

I want to get a multisync monitor of some kind which I could use with my ST or STe for both Mono and Colour modes. I know a NEC 3D can be used, although I don't know the connections. Are there any others which can be recommended? Especially if they are lower cost!

Also, does anyone have details of the connections required in each mode?

Thanks in advance for any info,

Tony.

Umm... sort of.

I'm in the process of writing a UNIX filesystem for the ST (i-nodes and group permissions on the ST :-) Its going fine. I cant say that I need to though....

The best thing to write is 1) Text output routines. 2) GEM menus.
I've written replacements for both, and now have the ability to have nice smoooth scrolling (like SETUP smooth scrolling on vt100's), multiple fonts WITHOUT Gdos hassle, and custom blinking cursors (I like underline cursors).

I cant say its as good as the OS in all respects though, as it conforms rigidly to a grid layout - one per character. Maybe sometime...

As for menubars, well I have configurable menus, using any combination of 1) pull down (like on Mac). 2) Drop down, 3) Selection without using the buttons(!) [just point, select, and instead of click, just move the arrow off the right of the menu, which selects the current option], auto menu cancel (disappears when mouse moved outside menu),4) selection across whole screen (if not auto cancel, then only the mouse Y coordinate is checked when selecting options, so if menu is at left of screen, then running mouse up and down at far right of the screen still selects options in that menu), 5) Instant menus (like GEM) 6) Scroll-down menus (glide caramel smoothly as if lowered on a piece of paper - really neat!).

Of course these are only available from within my own programs. But maybe I'll work on those text routines and steal TRAP vectors....

You really don't want to use the operating system calls. Operating systems are for lamers. The only operating system call I ever use is go to supervisor mode. After this, I just rewrite any operating system routines I need - good practice, and the results are usually 10 times better than those using the op system. I've just finished rewriting all the operating system disk functions, and while this took a little work, formatting disks to weird formats is a dead sinch if you access the floppy disk controller directly. I don't know much about op system calls except they're all really shit, but I've read that you can't do much messing with disks using op system calls. You'll need some info to program the FDC directly. The book I used was Atari ST Disk Drives Inside, and Out from Abacus. It's a pretty good book.

1636. What is VDOS and why do I need it?

I got proqueue.arc from terminator last night only to find that it
was VDOS. I got VDOS a while back hoping that it was in fact a virtual
disk memory type thing, and found it a bit annoying, and deleted it.
So is it a virtual disk system? What does it do? Does anybody use it?
Why?
Happy Computing!

The monitor I saw was definitely called the SM144. It's already being
advertised here in the UK although at a higher advertised price than
the 'old' SM124'.

I'm an Amiga user, but I would *love* to see Atari stick it to
Nintendo. Nintendo has been keeping any competition out of major chain
stores by threatening the store owners that they will pull out of their
store if they carry anything but Nintendo. This is just one small tatic
that the Japanese use in order to control the market on a product. They
also will dump products (flat screen displays, minivans, semiconductors)
on the American market at below cost in order to put US competition out
of business. This is known as "attack capitalsim". Once the competition
no longer exists they will set their own price for that product. IBM<
Compaq, and Apple all now depend on Japanese vendors for flat top
display screens for their laptop computers. The US competition that
did exist was greatly weakend by the dumping. These Japanese vendors
can use other resources to keep the money flowing while they are not
making a profit off that product. Stick it to'em!

1641. 'Demo crews'

Newsgroup: comp.sys.atari.st
Date: 1992-02-18 20:54:39 UTC
From: sourada@iastate.edu
Message-ID: <sourada.698446479@vincent1.iastate.edu>
Source record: 225586

While looking at the demos for the ST, I often see mention of 'demo crews', and from the context I would assume these are groups of people who write demos together.

Is this a big thing in some countries (the bulk of the ones I've heard of are in Sweden or Germany, of course, that's where the bulk of the Ataris are also)? In America, it doesn't seem that demos are treated with any respect as an art form, but from the existence of demo crews, it seems somewhere this is respected as an art form.

The entire 'culture' of these demo crews sounds very interesting to me. Does anyone have any firsthand (or second, at least) knowledge of these crews?

Thanks,
Steven Ourada

From: sourada@iastate.edu
Message-ID: <sourada.698446847@vincent1.iastate.edu>
Source record: 225587

Pardon me if this is an ignorant question, but what exactly are .GEM files, and how can I view them? Atari supplied a few with the Developer's Kit (stuff they didn't bother to print), and I would like to see them. But, I have never seen a program that claimed to input or output .GEM files.

I would figure that they are either raw VDI-format files (in which case I would still need some sort of viewer) or some format DRI used for their integrated applications.

Later,
Steven Ourada

possibility of having bad ram chips ?>

Is it second hand? If it is then it may have had a memory upgrade
which was removed before selling. When fitting a 2Mb memory upgrade
to a 1040 you have to cut two resistors on the board in order to
disable one of the internal memory banks. So therefore if you take
the upgrade out you will have to resolder the resistors if you want
the full 1024k.

All this falls down if it hasn't had a memory upgrade at some stage.

1647. Fweb available for the ST

Newsgroup: comp.sys.atari.st
Date: 1992-02-18 23:00:53 UTC
From: petcher@wuphys.wustl.edu
Message-ID: <1992Feb18.230053.26999@wuphys.wustl.edu>
Source record: 225590

Some of you may be interested to know that fweb (available via ftp from lyman.ppl.gov, that's 192.55.106.129) compiles virtually without change (just minor customizations - see similar post in comp.sys.atari.st.tech) with the latest version of gcc and libraries at atari.archive. If you are interested, please give it a try. If you don't have the resources and want a copy of the executables, please email me. I don't want to post them yet, because they need some more testing, and should be considered a beta version, but so far I was able to tangle the fweb code for the fweb program itself which is a pretty good test for part of it.

For those who do not know what fweb is, it is a derivative of the language, web, by Donald Knuth, in which TeX was written. This language allows you to put source code and TeX commentary in the same file. Passing the web code through the preprocessor fweave produces TeX output to be used as documentation, and passing it through the preprocessor ftangle produces compiler ready source code. Whereas the original web language handled pascal only, fweb handles fortran, fortran90, C and C++. It is extremely useful for collaboarations among other things, when well documented code is crucial.

Cheers, petcher@wuphys.wustl.edu
Don Petcher

>BTW, Is there a function that will "Crack" the art from a game or
>program?

Yes, the icons with the cracks in the allow disk or file cracking. It is pretty cumbersome though, as you don't actually scroll around the loaded file - you pick a format you want to load in (ie. width, etc) and an offset into the file, then reload each time.

At least that's all I could work out.

Has anyone worked out the "exchange" function on the colour palette yet?

Does anyone know where I can get a copy of either:

FontEdit.ACC or Multifont (MULTIFON.ACC)

Thanx.

Yours truly,

1656. 4 Joysticks using parallel port (Gauntlet II)

Newsgroup: comp.sys.atari.st
Date: 1992-02-19 11:38:09 UTC
From: s883334@minyos.xx.rmit.oz.au
Message-ID: <1992Feb19.113809.4663@minyos.xx.rmit.oz.au>
Source record: 225461

I have gauntlet II amongst a set of 20 games that came with my atari
when I purchased it. Unfortunately, its only documentation is a small
card accompanying the disk. Ive heard that its possible to use an
additional 2 joysticks under Gauntlet II, using the parallel port.

Does anyone have the wiring diagrams to do this ? Thanks.

James.

>ST?
>
>Thanks.

I work on a version of MicroEMACS 3.11 for the ST. I am not finished
yet. This version will run in GEM-windows, so that the concept of
SCREENs will be implemented.
But I also adapted the `normal' text-version. This
alpha-test-version is availible via tftp. Try

tftp obelix.uni-muenster.de
binary
get /user/u91w/u91w007/public_out/emacs.zoo
quit

BUT: There are still some bugs. MicroEMACS does have some problems
with 8-bit-characters. (especially if you try to search or replace
them).
Please be patient, I will be finished soon...

P.S.: For those using MGR: I also wrote a version using TERMCAP...

Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

The Mega STe Keyboard is OK. It is an all new one and not the
Mega ST or ST keyboard.
Since the likes and dislikes are very personal, i would encourage
you to test it in a shop.
I like the keyboard more than the IBM Keyboards, but i never liked
that keyboards much. A lot of the problems are problems with the
layaout and that did not change. (I have problems with the IBM
style layout, when i'm blind typing. There's no best solution)

Help would be apreciated on which archiver to use to extract
das_omen.dcm and expo91dem.dcm, could the person who posted these please post
telling us what archiver he used.

Thanks

Dave Smith

1660. HC24_H12 uploaded at a.a.

Newsgroup: comp.sys.atari.st
Date: 1992-02-19 13:10:03 UTC
From: hohr@cernvax.cern.ch
Message-ID: <9670@cernvax.cern.ch>
Source record: 225456

Hi Atarians,

I've just uploaded "hc24_h12.arc" on atari.archive.umich.edu, in the "new"
folder. Source file is also provided. Here's the associated READ_ME file:

HC24_H12.PRG

This utility replaces the internal hard-copy routine (for 9 pin printers)
by an other one for LQ500 compatible 24 pin printers (high resolution only).

In addition, it respects the x/y ratio (circles on the screen are also
circles on the paper) and it will give you a realy good printout of about
180x115 mm. in horizontal format.

The negative parts are that you need a printer spooler of 128kb, and that
it will thake about 23 seconds on a Mega STE (at 16Mhz+cache) before you get
the hand back, even if it is, like this version, compiled with the Pure-C
compiler (Thanks Ulf).

To be put in your \AUTO\ folder. Use it at your own risk: it's absolutely
free. If modified, please let me know. Not to be sold or for commercial use.
